CITY COUNCIL REPORTS ON REGIONAL ACTIVITIES

a) Report by Council Member Robin N. Hastings on the Western Riverside Council of Governments (WRCOG)

This page intentionally left blank.

MV00168219

APPROVALS	
BUDGET OFFICER	
CITY ATTORNEY	
CITY MANAGER	

Report to City Council

TO: Mayor and City Council

FROM: Jane Halstead, City Clerk, CMC

AGENDA DATE: June 26, 2012

TITLE: APPOINTMENTS TO THE CITY COUNCIL ADVISORY BOARDS AND COMMISSIONS

RECOMMENDED ACTION

Staff recommends that the City Council:

1. Review the ballots for appointments to various City Council Boards and Commissions (to be provided by the City Clerk) and mark your choices where appropriate;

2. Appoint those applicants who received majority vote by the City Council; and

3. If vacancies are not filled by a majority vote of the City Council, authorize the City Clerk to re-advertise the positions as vacant and carry over the current applications for reconsideration of appointment at a future date.

ADVISORY BOARD/COMMISSION RECOMMENDATION

Not applicable.

BACKGROUND

Applications were accepted by the City Clerk's Office to fill vacancies for the various City Council Boards and Commissions, with certain terms expiring June 30, 2012.

Members with expiring terms were notified and advised of the need to submit a new application to be considered for reappointment. Appropriate time frames with respect to posting notices of vacancies were followed.

As provided in the City's Municipal Code, the appointees will serve without compensation for designated terms.

Pursuant to Municipal Code Subsection 2.06.010(e), "Unless otherwise specifically provided by the action establishing the body or appointing its initial members, no person shall be at the same time a member of more than one citizens' advisory body created by ordinance or resolution of the City Council." This section of the code is waived for members of the Accessibility Appeals Board. Mary McBean applied for the Arts Commission, Environmental and Historical Preservation Board and the Library Commission.

The commissions, boards, applicants, and vacancies to be filled are as follows:

ACCESSIBILITY APPEALS BOARD

One (1) term expiring June 30, 2015
Public Representative

None

ARTS COMMISSION
Three (3) terms expiring June 30, 2015

Mary McBean**
Ruth A. Van Hala*

ENVIRONMENTAL AND HISTORICAL PRESERVATION BOARD
Two (2) terms expiring June 30, 2015

Michelle Terese Gerard
Mary McBean**
Carla Jennifer Thornton*

LIBRARY COMMISSION
Two (2) terms expiring June 30, 2015

Mary McBean

PARKS AND RECREATION COMMISSION
Two (2) terms expiring June 30, 2015

Jonneshia C. Bright
Latrece Bright
James Lucha

RECREATIONAL TRAILS BOARD
Three (3) terms expiring June 30, 2015

Angelyn L. Grady
Radene Ramos Hiers*
Brenda Y. Jackson*
Vivian Joneswhye-Brock*

SENIOR CITIZENS' BOARD
Three (3) terms expiring June 30, 2015

Cleveland Johnson*

TRAFFIC SAFETY COMMISSION
Two (2) terms expiring June 30, 2015

Michael Riiff
Wraymond Sawyerr *

*Incumbent
** Applied for more than one position

ALTERNATIVES

Members of the Council appointed boards and commissions serve in an advisory capacity to the City Council. Choosing not to appoint members to the above-mentioned boards and commissions would result in decreased participation from residents. This option is not consistent with the City Council goal of creating a positive environment for the development of Moreno Valley's future. Therefore, staff recommends that the City Council make the recommended appointments.

Report to City Council

TO: Mayor and City Council

FROM: Michele Patterson, Assistant to the City Manager

AGENDA DATE: June 26, 2012

TITLE: JOB TRAINING LINKAGE INITIATIVE

RECOMMENDED ACTION

Staff recommends that the City Council approve the continued development of the Job Training Linkage Initiative in Moreno Valley.

BACKGROUND

Though some areas of the state and nation are beginning to experience improvement in unemployment rates, Moreno Valley's rate continues to be unusually high at 13.7%. Expressed in terms of local impact, 12,200 Moreno Valley residents are currently unemployed.

Committed to stimulating local improvement, the City Council adopted the Economic Development Action Plan in April 2011 and conducted a Goal Setting Workshop in May 2011. Both events established Job Development as a prioritized goal.

This last year, Moreno Valley's logistics industry has grown significantly. The City's monthly Economic Development Summary documents more than 15 million square feet of industrial buildings under development and many millions of square feet are in the planning stages:

- First Industrial Logistics Center: a proposal to develop a 397,000 square foot logistics building.
- March Business Center: a proposal to develop 75 acres into four industrial buildings totaling 1,484,407 square feet.
- VIP Moreno Valley Distribution Center: a proposed plan to develop a 1,616,133 square foot distribution facility on 71 acres.
- World Logistics Center: a proposed master plan for the development of up to 41.6 million square feet on 2,665 acres.

Unfortunately, creating jobs does not guarantee employment for Moreno Valley residents. Staff now proposes to offer subsidized logistics training that facilitates the selection of Moreno Valley residents to fill the expected employment opportunities.

As described by noted regional economist Dr. John Husing, Moreno Valley's demographics support logistics development. According to his source - the American Community Survey of 2010 - approximately 54% of Moreno Valley residents aged 25 or older have a high school diploma or less. In addition, a significant portion of Moreno Valley's workforce has been employed in residential construction. As the residential construction industry continues to experience recovery delays, the City has identified logistics as a growth industry that could offer the opportunity for upward mobility and replace lost residential construction jobs for these segments of Moreno Valley's population.

In FY 2007/08, the City's Neighborhood Preservation office introduced a job training program for the manufacturing and logistics industries. Known as the Community Talent Development Partnership, that program partnered with Riverside Community College District (RCCD) and was targeted to assist income-eligible, at-risk youth. Funded by a grant from the U.S. Department of Labor and by the City's Community Development Block Grant (CDBG), the program trained dozens of youth. However, it was discontinued when the grant funds were exhausted and few of the graduates found employment in the declining economy.

In 2009, the American Recovery and Reinvestment Act (ARRA) included a grant program identified as the High Growth and Emerging Industries Grant. A partnership of community colleges including RCCD formed the Southern California Logistics Technology Collaborative (SCLTC), which received an ARRA grant of $4,260,863 from the U.S. Department of Labor, Employment and Training Administration to fund new vocational training programs. As a member of the SCLTC, RCCD has been bringing new vocational training to Riverside County residents at their Corona location and has facilitated the employment of more than 150 people.

Staff has engaged in planning discussions with SBCCD and RCCD. ARRA grant funds continue to be available through early 2013 and RCCD has indicated their support for providing training to several cohorts of Moreno Valley residents through the end of 2012.

DISCUSSION

Staff recommends that the City Council approve the continued development of the Job Training Linkage Initiative, to be funded until the end of 2012 by RCCD through the SCLTC's ARRA grant.

The Manufacturing Skill Standards Council (MSSC) has created a credentialing system that covers core competency areas for logistics employees, as defined by MSSC's industry-led, nationally-validated skills standards for higher skilled, frontline material handling workers across all supply chain facilities: factories, warehouses, distribution centers, fulfillment centers, and transporters.

Understanding MSSC's credentialed training program, RCCD and City staff met with representatives of Masonite, Ralph's, Ross Dress For Less, Ryder, Skechers, United Natural Foods, Inc., and Walgreens distribution centers to confirm that the curriculum supports the employee knowledge, skills and experience that each requires. The proposed program format is derived from those conversations.

Enrollment Eligibility

If the City Council approves, the proposed training will be available free of charge to all eligible Moreno Valley residents. MSSC training recognizes the employers' need for employability, academic, and technical skills. All of the proposed programs incorporate an intake assessment to ensure that students meet the minimum knowledge, experience, and skill pre-requisites. MSSC strongly recommends that individuals be at the 9th grade level of English, math and critical thinking before attempting MSSC courses and assessments. In addition, all students must pass a drug test prior to admission into the program.

Proposed Training

If approved, two Logistics Certification credentials will be offered: the foundational-level Certified Logistics Associate (CLA) certificate and the mid-level Certified Logistics Technician (CLT) certificate. CLA certification is a prerequisite for CLT enrollment. In addition, with emerging logistics technologies, many distribution centers offer positions that require advanced skills in programming and maintenance of robotics, conveyors, computer numerical control, and programmable logic control (PLC) systems. Staff is proposing that RCCD offer the Automation Technologies courses in Moreno Valley to enable residents with three years of experience in a related field to train and successfully compete for as many of these new positions as possible.

Some Moreno Valley residents with logistics experience may only need forklift certification. RCCD will provide a short-term 3-day orientation that will enable students to gain their OSHA Safety Standards (10-hour card). Finally, in the event that several residents need a refresher to pass the 9th grade English / math assessment(s), RCCD would offer an Employability Skills course.

The curriculum of each program is summarized in Attachment A.

Coordination with Moreno Valley High Schools

The current logistics growth, high unemployment rate, and expiring grant funding demand immediate, relevant training for adults. In addition, the longer-term vision for

the development of the City's logistics workforce would expand the training program to Moreno Valley's high school students.

Establishing curriculum for high school credit requires review by a curriculum committee, which could involve a six-month to one-year evaluation period. Staff has engaged in preliminary discussions with Superintendent Dr. Judy White from Moreno Valley Unified School District (MVUSD) and will make a similar proposal to Val Verde Unified School District (VVUSD) regarding a series of courses to be offered through each districts' Career Technical Education programs.

Schedule

If the City Council approves, staff propose to offer the following training cohorts of approximately 20 students each:

- CLA / CLT: Two cohorts by Fall 2012.
- Automation Technologies: One cohort by Fall 2012
- 3-day Forklift Orientation: Potential for one cohort by Fall 2012, if RCCD identifies enough students
- Employability Skills: Potential for one cohort concurrently offered with the first CLA class, if RCCD identifies enough students. Once students pass the assessments, they would be eligible to participate in the second CLA cohort.

Training Location

As a member of the SCLTC, RCCD has been bringing new vocational training to Riverside County residents at their Corona location and this proposal would expand the training to include a Moreno Valley location. To ensure convenient access for Moreno Valley residents, staff has confirmed the availability of the Moreno Valley Employment Resource Center as the training location through 2012. Moreno Valley Unified School District has also expressed enthusiasm for providing a training classroom. Forklift training will be conducted in the Hunter Park area of Riverside, near the intersection of Columbia and Iowa Avenues.

ALTERNATIVES

Alternative 1: Approve the continued development of the Job Training Linkage Initiative in Moreno Valley. **Staff recommends this alternative because the training will enable the employment of Moreno Valley residents in the growing logistics industry.**

Alternative 2: Decline to approve the continued development of the Job Training Linkage Initiative in Moreno Valley. **Staff does not recommend this alternative.**

FISCAL IMPACT

There is no fiscal impact on the City's funds. If the City Council approves the proposed programs, RCCD will fund the training through the end of 2012 from the $4,260,863 grant awarded under the American Recovery and Reinvestment Act of 2009 to the Southern California Logistics Technology Collaborative, of which RCCD is a partner.

RCCD is participating in an application to extend the grant performance period and they are also seeking new grant opportunities. If the grant funding expires as scheduled in February 2013, the City could consider funding additional cohorts through CDBG, as has been used in the past. Such a proposal would be brought back to the City Council in the future for separate consideration.

CITY COUNCIL GOALS

Positive Environment. Create a positive environment for the development of Moreno Valley's workforce.

SUMMARY

Moreno Valley's logistics industry is growing. However, creating local jobs does not guarantee employment for Moreno Valley residents.

A partnership of community colleges including Riverside Community College District (RCCD) formed the Southern California Logistics Technology Collaborative (SCLTC), which received an American Recovery and Reinvestment Act of 2009 (ARRA) grant of $4,260,863 from the U.S. Department of Labor, Employment and Training Administration. The grant is funding vocational training programs. As a member of the SCLTC, RCCD has been bringing new vocational training to Riverside County residents at their Corona location.

Staff proposes to offer subsidized logistics training programs in Moreno Valley that facilitate selection of Moreno Valley residents to fill the expected logistics employment opportunities. Specific logistics training programs are summarized on Attachment A and would include:

- The foundational-level Certified Logistics Associate (CLA) certificate.
- The mid-level Certified Logistics Technician (CLT) certificate.
- Automation Technologies.
- Forklift Certification / 3-day Orientation: For residents with distribution center experience but who lack current forklift certification.
- Employability Skills: a refresher in 9th grade English / math.

Staff recommends that the City Council approve the continued development of the Job Training Linkage Initiative in Moreno Valley.

LOGISTICS TRAINING CURRICULUM

The Manufacturing Skill Standards Council (MSSC) has created a credentialing system that covers core competency areas for logistics employees across all supply chain facilities: factories, warehouses, distribution centers, fulfillment centers, and transporters.

MSSC training recognizes the employers' need for employability, academic, and technical skills. All of the proposed programs incorporate an intake assessment to ensure that students meet the minimum knowledge, experience, and skill pre-requisites. MSSC strongly recommends that individuals be at the 9th grade level of English, math and critical thinking before attempting MSSC courses and assessments. In addition, all students must pass a drug test prior to admission into the program.

Certified Logistics Associate – 60 hours

- Intro. to Global Supply Chain Logistics
- Material Handling Equipment
- Material Handling & Equipment Operation
- Quality Control Principles
- Work Communication
- Teamwork & Good Workplace Conduct
- Computer Systems for Logistics
- OSHA Safety Standards (10-hour card)

Certified Logistics Technician* – 36 hours

- Product Receiving
- Product Storage
- Order Processing
- Packaging & Shipment
- Inventory Control
- Safe Handling of Hazardous Material
- Evaluation of Transportation Modes
- Dispatch & Tracking Operations

* CLA certification is a prerequisite for CLT enrollment.

Automation Technologies – 100 hours

- Electrical & Motor Controls
- Programmable Logic Controllers (PLC)
- Integrated Automation & Troubleshooting
- OSHA Safety Standards (10-hour card)

Forklift Certification – 3-day Orientation

For those residents who possess distribution center experience but lack current forklift certification (which is frequently issued and retained by each employer), the City / RCCD will provide a short-term 3-day orientation that will enable students to gain their OSHA Safety Standards (10-hour card).

Employability Skills

In the event that several residents need a refresher to pass the 9th grade English / math assessment(s), RCCD would offer an Employability Skills course. Once a student passes the assessments, he or she would be eligible for the next CLA / CLT cohort.

APPROVALS	
BUDGET OFFICER	
CITY ATTORNEY	
CITY MANAGER	

Report to City Council

TO: Mayor and City Council

FROM: Barry Foster, Community & Economic Development Director

AGENDA DATE: June 26, 2012

TITLE: AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF MORENO VALLEY, CALIFORNIA, AMENDING SUB-SECTION 9.12.050(F) OF TITLE 9 OF THE CITY OF MORENO VALLEY MUNICIPAL CODE AND ADDING SUB-SECTION 9.12.060(O) TO TITLE 9 OF THE CITY OF MORENO VALLEY MUNICIPAL CODE RELATING TO SIGNS IN THE PUBLIC RIGHT-OF-WAY.

RECOMMENDED ACTION

Staff recommends that the City Council introduce the proposed Ordinance No. 850, an Ordinance of the City Council of the City of Moreno Valley, California amending sub-section 9.12.050(F) of Title 9 of the City of Moreno Valley Municipal Code and adding sub-section 9.12.060(O) to Title 9 of the City of Moreno Valley Municipal Code relating to signs in the public right-of-way.

BACKGROUND

The existing Right-of-Way (ROW) within Sunnymead Boulevard is not symmetrical from the centerline and is shifted approximately ten (10) feet to the south. The result of this shift is that there are several signs that find themselves located within the public ROW where they otherwise would not be situated had the ROW been consistant on each side of the roadway. One example is the sign for the Chicago Pasta House, which is now located within the public ROW. Chicago Pasta House is looking to reconstruct its monument sign, but is prohibited under the existing Municipal Code.

DISCUSSION

City staff is recommending an update to Title 9 of the MVMC in order to accommodate the off-set ROW of Sunnymead Boulevard (from Frederick Street to Perris Boulevard).

Listed below are key proposed changes to various portions throughout sub-sections 9.12.050 and 9.12.060 of Title 9 of the existing municipal code:

- Amend the Municipal Code to include an additional exception to those signs within the public right-of-way of Sunnymead Boulevard
- Add a subsection to specify the circumstances and provisions under which a sign permit would be considered for approval

An administrative policy will be drafted to address signage within the public Right-of-Way of Sunnymead Boulevard and will establish the limitations and requirements of such a condition, including requiring the issuance of an encroachment permit, liability insurance and compliance with all other aspects of Chapter 9 of the City of Moreno Valley Municipal Code.

ALTERNATIVES

1. Approve the introduction of the proposed Ordinance No. 850, an Ordinance of the City Council of the City of Moreno Valley, California amending sub-section 9.12.050(F) of Title 9 of the City of Moreno Valley Municipal Code and adding sub-section 9.12.060(O) to Title 9 of the City of Moreno Valley Municipal Code relating to signs in the public right-of-way. **This alternative is recommended by staff.** *Approval would allow limited approval of certain signs which encroach into the public ROW.*

2. Do not approve the introduction of the proposed Ordinance No. 850, an Ordinance of the City Council of the City of Moreno Valley, California amending sub-section 9.12.050(F) of Title 9 of the City of Moreno Valley Municipal Code and adding sub-section 9.12.060(O) to Title 9 of the City of Moreno Valley Municipal Code relating to signs in the public right-of-way. **This alternative is not recommended by staff.** *Any signs found to be within the public ROW would be in violation of the Municipal Code and subject to fines by the City.*

FISCAL IMPACT

There are no fiscal impacts associated with the proposed action.

CITY COUNCIL GOALS

Advocacy. Develop cooperative intergovernmental relationships and be a forceful advocate of City policies, objectives, and goals to appropriate external governments, agencies and corporations.

Community Image, Neighborhood Pride and Cleanliness. Promote a sense of community pride and foster an excellent image about our City by developing and executing programs which will result in quality development, enhanced neighborhood preservation efforts, including home rehabilitation and neighborhood restoration.

ORDINANCE NO. 850

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF MORENO VALLEY, CALIFORNIA, AMENDING SUB-SECTION 9.12.050(F) OF TITLE 9 OF THE CITY OF MORENO VALLEY MUNICIPAL CODE AND ADDING SUB-SECTION 9.12.060(O) TO TITLE 9 OF THE CITY OF MORENO VALLEY MUNICIPAL CODE RELATING TO SIGNS IN THE PUBLIC RIGHT-OF-WAY

The City Council of the City of Moreno Valley does hereby ordain as follows:

SECTION 1. AMENDMENT OF SUB-SECTION 9.12.050(F) OF SECTION 9.12.050 OF CHAPTER 9.12 OF THE MORENO VALLEY MUNICIPAL CODE:

1.1. Sub-Section 9.12.050(F) of Chapter 9.12 of Title 9 of the City of Moreno Valley Municipal Code is hereby amended to read, in its entirety, as follows:

"Signs within the public right-of-way, except those required by a governmental agency and temporary political signs and off-site directional signs subject to the provisions of Sections 9.12.040(H) and 9.12.060(L) of this chapter. Modified Monument Signs located in the public right-of-way subject to the provisions of Section 9.12.060(O) of this chapter may also be permitted."

SECTION 2. ADDITION OF SUB-SECTION 9.12.060(O) OF SECTION 9.12.060 OF CHAPTER 9.12 OF THE MORENO VALLEY MUNICIPAL CODE:

2.1 Sub-Section 9.12.060(O) of Chapter 9.12 of Title 9 of the City of Moreno Valley Municipal Code is hereby added to read, in its entirety, as follows:

"O. Signs in the Public Right-Of-Way

1. A Modified Monument Sign that is otherwise permissible pursuant to Section 9.12.060(B)(1) of this chapter and located in the public-right-of-way may be permitted in the following circumstances:
    a. The sign is located within a public right-of-way controlled by the City of Moreno Valley;
    b. The sign is located along Sunnymead Boulevard between Frederick Street and Perris Boulevard;
    c. There is no practicable location on private property to locate the sign;
    d. The sign design and location do not obstruct or impede any utility, utility access, pedestrian walkways or pedestrian or vehicle sight lines.
    e. The sign design and location are not located over or upon any other easement without written authorization for such from the owner of the easement.

f. An encroachment permit is obtained, all fees paid, and all required insurance and other requirements are kept current and valid;
g. A sign permit is obtained in accordance with this Chapter.

2. In order to apply for a permit for a sign in the public right-of-way pursuant to this Section, an application must first be made for an encroachment permit and all criteria for such encroachment permit must be met.
3. In the event that any of the requirements or terms of the encroachment permit are not met or are not continually maintained in accordance with the encroachment permit, any sign permit shall become void and such sign shall become a public nuisance and may be removed by the City at any time at the sign owner's expense.
4. Any such sign in the public right-of-way shall be immediately removed from the public right-of-way upon request by the City for any public purpose and shall not be entitled to any compensation."

SECTION 3. EFFECT OF ENACTMENT:

3.1 Except as specifically provided herein, nothing contained in this ordinance shall be deemed to modify or supersede any prior enactment of the City Council which addresses the same subject addressed herein.

SECTION 4. NOTICE OF ADOPTION:

4.1 Within fifteen days after the date of adoption hereof, the City Clerk shall certify to the adoption of this ordinance and cause it to be publicly posted in three places within the city.

SECTION 5. EFFECTIVE DATE:

5.1 This ordinance shall take effect thirty days after the date of its adoption.

APPROVED AND ADOPTED this 10th day of July, 2012.

CITY OF MORENO VALLEY)

I, Jane Halstead, City Clerk of the City of Moreno Valley, California, do hereby certify that Ordinance No. 850 had its first reading on June 26, 2012 and had its second reading on July 10, 2012, and was duly and regularly adopted by the City Council of the City of Moreno Valley at a regular meeting thereof held on the 10th day of July, 2012, by the following vote:

AYES:

NOES:

ABSENT:

ABSTAIN:

(Council Members, Mayor Pro Tem and Mayor)

_____

CITY CLERK

(SEAL)

ORDINANCE NO.847

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF MORENO VALLEY, CALIFORNIA, APPROVING APPLICATION PA12-0008 AMENDING THE MUNICIPAL CODE TO INCREASE THE MAXIMUM HEIGHT AND SIGN AREA FOR MENU BOARDS IN THE CITY'S SIGN CODE IN SECTION 9.12.060.D.

The City Council of the City of Moreno Valley does ordain as follows:

SECTION 1. PRIOR ENACTMENTS REPEALED:

1.1 All prior enactments of the City, which are in conflict with this Ordinance, are hereby repealed, effective upon the date which this Ordinance becomes effective and operative.

SECTION 2: FINDINGS

2.1 With respect to the proposed Municipal Code Amendment, and based upon substantial evidence presented to the City Council during the public hearing on June 12, 2012, including written and oral staff reports, and the record from the public hearing, the City Council hereby specifically finds as follows:

1. Conformance with General Plan Policies – The proposed Municipal Code Amendment is consistent with the General Plan, and its goals, objectives, policies and programs.

   FACT: General Plan policy 2.10.6 states that signs should be highly compatible with the building and site design relative to size, color, material, and placement. Policy 7.7.3 states that reasonable controls should be implemented on the size, number and design of signs to minimize degradation of visual quality. The changes proposed to the Municipal Code are consistent with the General Plan and do not conflict with the goals, objectives, policies, and programs established within the Plan.

2. Health, Safety and Welfare – The proposed amendment will not adversely affect the public health, safety or general welfare.

   FACT: Although the proposed amendment will be effective citywide, it addresses minor land use matters and does not have the potential to adversely affect the public health, safety or welfare of the population residing in the City of Moreno Valley or surrounding jurisdictions. As a minor alteration to land use limitations,

the Municipal Code Amendment is determined to be exempt under California Environmental Quality Act Guidelines, per Section 15305, as a Class 5 Categorical Exemption.

3. Conformance with Title 9 – The proposed Municipal Code Amendment is consistent with the purposes and intent of Title 9.

FACT: The purpose and intent of the City's sign regulation as stated in Municipal Code Section 9.12.060 is to aid in the identification of land uses and facilities to provide for public convenience; encourage signs that are attractive, discourage clutter and maintain a high quality visual image for the community; promote the economic well-being of local businesses and the community; reduce traffic and safety hazards; and ensure that signs are in keeping with the goals, objectives and policies of the city of Moreno Valley general plan. As proposed, the Municipal Code Amendment is consistent with the purposes and intent of Title 9.

SECTION 3 MUNICIPAL CODE AMENDMENT:

3.1 The City's sign regulations in Chapter 9.12 of Title 9 of the City of Moreno Valley Municipal Code in Section 9.12.060.D are hereby revised as follows:

D. Drive-Through Restaurant Menu Boards. Two additional signs shall be permitted for the purpose of displaying the type and price of products sold on-site to drive-through customers. Such signs may include a speaker system to allow drive-through customers to order food and beverages. Such signs shall not exceed forty-eight (48) square feet in area and eight feet in height inclusive of the base. If the restaurant elects to build only a single menu board, the sign shall not exceed 64 square feet and the height shall not exceed eight feet inclusive of the base.

SECTION 4: EFFECT OF ENACTMENT:

4.1 Except as specifically provided herein, nothing contained in this ordinance shall be deemed to modify or supersede any prior enactment of the City Council which addresses the same subject addressed herein.

SECTION 5: NOTICE OF ADOPTION:

5.1 Within fifteen days after the date of adoption hereof, the City Clerk shall certify to the adoption of this ordinance and cause it to be posted in three public places within the city.

SECTION 6: EFFECTIVE DATE:

6.1 This ordinance shall take effect thirty days after the date of its adoption.

APPROVED AND ADOPTED this 26th day of June, 2012.

Ordinance No. 847
Date Adopted: June 26, 2012

ORDINANCE NO. 848

AN ORDINANCE OF THE CITY COUNCIL OF THE CITY OF MORENO VALLEY, CALIFORNIA, AMENDING SECTION 12.22.030 OF CHAPTER 12.22 OF THE CITY OF MORENO VALLEY MUNICIPAL CODE RELATING TO THE DESIGNATION OF THROUGH STREETS.

The City Council of the City of Moreno Valley does ordain as follows:

SECTION 1. AMENDMENT TO THE MUNICIPAL CODE:

Section 12.22.030 of the City of Moreno Valley Municipal Code is hereby amended as follows:

Name of Through Street	Inclusive Limits
Alessandro Boulevard	West city limit to east city limit east of Theodore Street
Bay Avenue	West city limit to Heacock Street; Ramsdell Drive to Morrison Street; Moreno Beach Drive to Merwin Street
Box Springs Road	Morton Road to Day Street
Brodiaea Avenue	Frederick Street to Lasselle Street; Moreno Beach Drive to Redlands Boulevard
Cactus Avenue	West city limit to terminus east of Redlands Boulevard
Campus Parkway	Day Street to Towngate Circle
Cottonwood Avenue	West city limit to Redlands Boulevard
Day Street	Old 215 Frontage Road to Ironwood Avenue
Delphinium Avenue	Heacock Street to Lasselle Street
Dracaea Avenue	West city limit to Nason Street
Elder Avenue	Terminus west of Perris Boulevard to Nason Street
Elsworth Street	Cactus Avenue to Eucalyptus Avenue
Encilia Avenue	Eucalyptus Avenue (W) to Eucalyptus Avenue (E)
Eucalyptus Avenue	West city limit to Towngate Boulevard; Towngate Boulevard to Nason Street; Nason Street to Gilman Springs Road

Fir Avenue	Heacock Street to Nason Street; Nason Street to Eucalyptus Avenue
Frederick Street	Cactus Avenue to State Highway 60
Gentian Avenue	Heacock Street to Indian Street; Perris Boulevard to Camino Flores
Gilman Springs Road	Eucalyptus Avenue to south city limit
Graham Street	Cactus Avenue to Sunnymead Boulevard; David Lane to Woodlander Way
Heacock Street	Nandina Avenue to Perris Boulevard
Hemlock Avenue	Pigeon Pass Road to Kitching Street
Highland Boulevard	Ironwood Avenue to Redlands Boulevard
Indian Street	South city limit to Manzanita Avenue
Iris Avenue	Heacock Street to Moreno Beach Drive
Ironwood Avenue	Day Street to Theodore Street
John F. Kennedy Drive	West city limit to Lasselle Street; Oliver Street to Redlands Boulevard
Kitching Street	Elder Avenue to Jaclyn Avenue; Sunnymead Boulevard to south city limit
Krameria Avenue	Heacock Street to Lasselle Street
Lasselle Street	Sunnymead Boulevard to south city limit
Locust Avenue	Moreno Beach Drive to Redlands Boulevard
Manzanita Avenue	Heacock Street to Perris Boulevard
Moreno Beach Drive	Locust Avenue to Iris Avenue
Morrison Street	Eucalyptus Avenue to Cactus Avenue
Nason Street	Ironwood Avenue to Iris Avenue
Nandina Avenue	Heacock Street to Perris Boulevard
Old Lake Drive	Pigeon Pass Road to Sunnymead Ranch Parkway
Oliver Street	Iris Avenue to Alessandro Boulevard
Perris Boulevard	South city limit to Reche Vista Drive

Ordinance No. 847
Date Adopted: June 26, 2012

Pigeon Pass Road	North city limit to State Highway 60
Quincy Street	Locust Avenue to Ironwood Avenue; Eucalyptus Avenue to Cactus Avenue
Reche Vista Road	Heacock Street to north city limit
Redlands Boulevard	North city limit north of Locust Avenue to Cactus Avenue
San Michele Road	Heacock Street to Perris Boulevard
Sinclair Street	Eucalyptus Avenue to Alessandro Boulevard
Sunnymead Boulevard	Lasselle Street to Frederick Street
Sunnymead Ranch Parkway	Pigeon Pass Road to Perris Boulevard
Theodore Street	Ironwood Avenue to Alessandro Boulevard
Veterans Way	Cactus Avenue to Alessandro Boulevard

SECTION 2. EFFECT OF ENACTMENT:

Enacting this ordinance will modify the current limits of designated through streets in the City of Moreno Valley. Except as specifically provided herein, nothing contained in this ordinance shall be deemed to modify or supersede any prior enactment of the City Council which addresses the same subject addressed herein.

SECTION 3. NOTICE OF ADOPTION:

Within fifteen days after the date of adoption hereof, the City Clerk shall certify to the adoption of this ordinance and cause it to be posted in three public places within the city.

Ordinance No. 847
Date Adopted: June 26, 2012

SECTION 4. EFFECTIVE DATE:

This ordinance shall take effect thirty days after the date of its adoption.

APPROVED AND ADOPTED this 26th day of June, 2012.

The City of Moreno Valley complies with the Americans with Disabilities Act of 1990. If you need special assistance to participate in this meeting, please contact Mel Alonzo, ADA Coordinator at (951) 413-3027 at least 48 hours prior to the meeting. The 48-hour notification will enable the City to make arrangements to ensure accessibility to this meeting.

NON-PUBLIC HEARING ITEMS

APPROVAL OF MINUTES

PUBLIC HEARING ITEMS

1. Case Number: P11-090, PA09-0004, and PA09-0022

Case Description: Plot Plan and Tentative Parcel Map 36162 for development of a 1.6 million square foot warehouse facility on approximately 80 acres. Certification of an Environmental Impact Report is required for approval of this project.

Case Type: Environmental Impact Report, Plot Plan for a 1.6 million square foot warehouse, and Tentative Parcel Map 36162

Applicant: Vogel Engineers, Inc.

Owner: Vogel Engineers, Inc.

Representative: RKZ, Inc.

Location: The project is located within the Moreno Valley Industrial Area Plan (SP 208) at the City's southern boundary, between Perris Boulevard and Indian Street and between Grove View Road and the Perris Valley storm channel.

Proposal: The project is generally described as a Plot Plan (PA09-0004) for development of a 1,616,133 square foot warehouse distribution building on a 71.13 net acre site. The building includes 268 dock high doors and 44,000 square feet of office area in four potential office locations. Tentative Parcel Map No. 36162 (PA09-0012) is proposed to combine four existing parcels into a single parcel for development of the 1.6 million square warehouse distribution facility. Certification of an Environmental Impact Report is required for approval of this project.

Case Planner: Jeff Bradshaw

1. **APPROVE** Resolution No. 2012-16 and thereby: **CERTIFY** that the Environmental Impact Report (EIR) for the VIP Moreno Valley Project has been completed in compliance with the California Environmental Quality Act; and,

2. **APPROVE** Resolution No. 2012-17 and thereby: **APPROVE** PA09-0004 (Plot Plan) and PA09-0012 (Tentative Parcel Map

36162), subject to the attached conditions of approval included as Exhibits A and B.

2. Case Number: PA11-0013
Case Description: Modify specific sections of the Municipal Code necessary to adopt Reach Codes.
Case Type: Development Code Amendments
Applicant: City of Moreno Valley
Owner: Same as above
Representative: Same as above
Location: Citywide
Proposal: Modify Title 9 of the Municipal Code for energy efficiency measures equal to and above current 2011 California Green Building Code standards necessary to adopt Reach Codes, including the modification of Section 9.05.040, "Industrial Site Development Standards", Section 9.17.030 "Landscape and Irrigation Design", Section 9.11.040 "Off Street Parking Requirements", Section 9.03.040 "Residential Site Development Standards, Section 8.80.020 "Waste Diversion Requirements" and Section 8.80.030 Waste Management Plan".
Case Planner: Mark Gross

Recommendation: **APPROVE** Resolution No. 2012-13 and thereby **RECOMMEND** that the City Council:

1. **RECOGNIZE** that the proposed Municipal Code Amendments are exempt from the California Environmental Quality Act (CEQA) Guidelines pursuant to Sections 15061 of the CEQA Guidelines; and,

2. **APPROVE** PA11-0013 to amend the Municipal Code to include various Municipal Code modifications and additions to allow for the adoption of Reach Codes (Attachment 2).

PLANNING COMMISSION
STAFF REPORT

Case:	PA09-0004 – Plot Plan PA09-0012 – Tentative Parcel Map No. 36162 P11-020 – Environmental Impact Report
Date:	July 12, 20112
Applicant:	Vogel Engineers, Inc.
Representative:	RKZ, Inc.
Location:	South side of Grove View Road between Perris Boulevard and Indian Street at the City's southern boundary, in the Moreno Valley Industrial Area Plan (SP 208),
Proposal:	Plot Plan for a 1,616,133 square foot warehouse distribution building to be developed on approximately 80 acres. The building includes 268 dock high doors and 44,000 square feet of office area in four potential office locations. Tentative Parcel Map No. 36162 proposes to combine four existing parcels into a single 80 acre parcel for development of the project. An Environmental Impact Report has been prepared for the project.
Recommendation:	Approval

SUMMARY

This project proposes the development of a 1,616,133 square foot warehouse facility on approximately 80 acres. The project also requires approval of a tentative parcel map, and certification of a Final Environmental Impact Report (EIR).

PROJECT DESCRIPTION

The applicant, Vogel Engineers, Inc. has submitted three applications for development of the VIP Moreno Valley Project, which include a plot plan, a tentative parcel map, and an EIR, in order to develop a 1,616,133 square foot warehouse facility on an approximate 80 acre site (Assessor's Parcel Numbers 316-210-071, -073, -075 and -076) located in the Moreno Valley Industrial Area Plan (SP 208), south side of Grove View Road between Perris Boulevard and Indian Street at the City's southern boundary.

Plot Plan

The Plot Plan is for a 1,616,133 square foot warehouse distribution facility. The warehouse facility is a permitted use in the Industrial zone of the Moreno Valley Industrial Area Plan (SP #208). The east and west elevations of the building are set back 125 from the property line along Perris Boulevard and Indian Street while the truck courts on the north elevation is set back 271 feet from the property line along Grove View Road and the south truck court is set back 261 feet from the Perris Valley Storm Channel.

The warehouse facility includes 268 loading docks with roll-up doors, truck staging and parking areas for 368 trailers within the enclosed truck court, two office areas and 589 parking spaces for employees and visitors. Proposed parking exceeds the City's requirements for trucks (1 per loading dock) and meets the employee/visitor parking for a warehouse use.

The loading and truck parking areas have been placed on the northern and southern elevations of the building. The truck courts are screened by perimeter concrete tilt-up walls on the north, east and west. A chain link fence with slats shall be provided along the project's southern property line to screen the truck loading and parking area from the Perris Valley Storm Channel, as permitted by the Specific Plan.

The project has been conditioned to provide standard parking lot and setback landscape to include ground cover, shrubs and trees. The project's Perris Boulevard, Indian Street and Grove View Road will be developed with standard curb, gutter, parkway, and sidewalk.

Tentative Parcel Map

Tentative Parcel Map No. 36162 is proposed to combine the four parcels located within the project site into a single parcel of approximately 80 acres, as well as provide all required street dedications and utility easements.

Site

The project site is currently vacant, consisting of gently sloping land that has been used historically for agricultural purposes but currently lies fallow. It was most recently used as a sod farm that ceased operating in August 2005. The major roads that provide access to the project site are Perris Boulevard, Indian Street, Grove View Street, and Harley Knox Boulevard, with the nearest I-215 interchanges at Harley Knox Boulevard and the Ramona Expressway.

Surrounding Area

The project is located in an area of predominately industrial land uses within the Moreno Valley Industrial Area Plan (SP #208). Land uses to the north include a Waste Management facility and a 426,700 square foot warehouse building. Land uses to the west include the 360,440 square foot i-Herb warehouse building, approximately 20 acres of vacant Industrial zoned land and a site currently used for container storage.

Further to the west is the southern approach to the runways at March Air Reserve Base. Land uses to the east include a ministorage facility, the approximately 255,000 square foot Masonite Door factory, and the approximate 1.2 million square foot Ross Dress For Less distribution facility.

The project site is located at the southerly City limits with a mixture of vacant Industrial zoned land and developed distribution land uses within the City of Perris on the south side of the Perris Valley Storm Drain.

Access

Access to the project site will be provided via two driveways on Indian Street, three driveways on Grove View Road, and two driveways on Perris Boulevard. The northern driveway on Perris Boulevard will be for passenger vehicle and emergency access only. The southern driveway on Perris Boulevard will align with the existing signalized intersection at the Ross Distribution Warehouse entrance. The north project driveway on Indian Street will be for passenger vehicle and emergency access only; all other driveways will be used by both passenger vehicles and trucks. The project is anticipated to be constructed by the year 2013.

The driveways and interior drive aisles associated with the project have been approved by the Fire Prevention Bureau for fire truck access and turnaround. The site has also been designed for adequate truck maneuvering and turnaround within the designated loading zones located on the north and south elevations of the building.

Design

Site design of the proposed warehouse distribution facility is consistent with requirements of the City's Municipal Code and the Moreno Valley Industrial Area Plan (SP #208).

The architectural design of the building is a concrete tilt-up construction. Building and wall colors include earthtones, with varying amounts of accent colors and vertical features to break up the architecture of building. Roof top equipment will be screened from public view by parapet walls.

Staff worked with the applicant to ensure that all sides of the building include architectural treatment. The loading bays and trailer storage areas along the northern and southern elevations have been screened from view. The screen wall along the north elevation is a fourteen (14) foot wall of concrete tilt-up construction which will match the building design and colors.

Landscaping for the site is proposed at around 9.5% of the site. The City's Municipal Code does not require a minimum percentage of landscape on a site. Instead, there are requirements for landscape setback areas along perimeter streets, parking lot landscape, street trees and landscape treatments around the perimeter of the buildings where visible from the public right-of-way. The project as designed meets the City's current landscape criteria.

Signs are not a part of this approval and will be reviewed and approved under separate administrative permit.

REVIEW PROCESS

In the review of this project, consideration was given to the potential impact to surrounding land uses by the proposed Plot Plan for the warehouse facility.

Upon review at PRSC in March 2009, modifications were required to the site plan. Comments from staff included revisions to the layout of the parking lot, access from adjacent roads, screening, architecture, typical street sections, grading and the submittal of required environmental and technical studies.

Subsequent PRSC reviews occurred in June and December 2009. The project then went inactive for a period of time.

In 2011, the applicant began working again with the City to address potential environmental concerns. Project technical studies were updated and staff determined that an environmental impact report was required pursuant to the California

Environmental Quality Act (CEQA). An application for an environmental impact report was subsequently submitted.

Upon review of a final draft of the site plan and completion of the draft Final Environmental Impact Report, a determination was made to schedule this project for a Planning Commission public hearing on May 12, 2012.

ENVIRONMENTAL

Initial Study/Notice of Preparation

An Initial Study was completed after all discretionary applications were deemed complete. Based on the information within the Initial Study, an Environmental Impact Report (EIR) was recommended to be prepared. A Notice of Preparation for the EIR was prepared, with the public comment period beginning on August 26, 2011 and ending on September 26, 2011. A public meeting to receive input on the issues to be covered by the EIR was held at City Hall on September 19, 2011.

Draft Environmental Impact Report

Subsequent to that meeting, draft environmental documents were prepared by the applicant's consultant LSA Associates, Inc. and submitted to the City and its peer consultant for review.

City staff and the peer review consultant reviewed the draft environmental documents for compliance with the California Environmental Quality Act (CEQA) Guidelines and required revisions to address identified questions and concerns. After revisions were incorporated into the document, the Draft EIR was circulated for a 45-day public review period, starting on April 20, 2012, and ending on June 4, 2012.

The Draft EIR was sent to all required State and local agencies and numerous interested parties on April 19, 2012, as well as to the City's Environmental and Historical Preservation Board. Eight comment letters were provided during the 45-day review period. An additional two letters were received after the end of the review period.

Final Environmental Impact Report

Responses to the eight comments received during the 45 day review period are included in the Response to Comments. Comment letters were received after the comment period from Eastern Municipal Water District (EMWD) and from the State Clearinghouse. These letters did not include comments on the project but were instead sent in recognition of the receipt of the Draft EIR. Responses to these letters were also provided and are included in the Final EIR.

The Response to Comments and related documents were mailed to all interested parties and responsible agencies on June 29, 2012, to allow for their review prior to Planning Commission hearing, to meet the notice period of 10 days required by CEQA. As was the case with the Draft EIR, the draft Final EIR was provided for public review at City Hall, the City Library and posted on the City's website.

Significant and Unavoidable Impacts

Analysis presented in the EIR indicates that the proposed project will have a number of potentially significant impacts, either as direct result of the proposed project or cumulatively with other proposed projects on agricultural resources, air quality, climate change, and traffic. The EIR includes a number of proposed mitigation measures to reduce or eliminate potential significant impacts. Even with proposed mitigation, a number of potential impacts cannot be reduced to a less than significant level. As identified in the document, these noted impacts above are considered to be significant and unavoidable.

Although impacts to agricultural resources, air quality, climate change and traffic cannot be reduced to less than significant levels, CEQA allows a decision making body to consider a statement of overriding considerations and findings. CEQA requires the decision making agency to balance the economic, legal, social, technological or other benefits of a proposed project against its unavoidable environmental impacts when determining whether to approve the proposed project. This would include project benefits such as the creation of jobs or other beneficial project features versus project impacts that cannot be mitigated to less than significant levels. If the decision making body determines that the benefits of a proposed project outweigh the unavoidable adverse environmental effects, it may approve a statement of overriding considerations and approve the project.

Mitigation Measures

The EIR includes mitigation measures intended to reduce project-specific and cumulative impacts for Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gas Emissions and Global Climate Change, Hydrology and Water Quality, Noise, and Traffic and Circulation. All other environmental effects evaluated in the EIR are considered to be less than significant without mitigation. With mitigation, anticipated impacts to Biological Resources, Cultural Resources, Geology and Soils, Hydrology and Water Quality and Noise are anticipated to be below significant thresholds.

Mitigation measures are included to reduce the environmental impacts where possible, even where the impacts could not be reduced to less than significant levels. All mitigation measures have also been included as conditions of approval for the project.

Approval and Certification

The Planning Commission will take public testimony on the EIR and project. Before the proposed project can be acted upon, the Planning Commission will need to review the final environmental document and either certify or reject the EIR and project Mitigation Monitoring Program.

NOTIFICATION

Public notice was sent to all property owners of record within 300' of the project. The public hearing notice for this project was also posted on the project site and published in the local newspaper. As of the date of report preparation, staff had received no public inquiries in response to the noticing for this project.

REVIEW AGENCY COMMENTS

Staff received the following responses to the Project Review Staff Committee transmittal; which was sent to all responsible reviewing agencies.

Agency	Response Date	Comments
Southern California Edison	February 25, 2009	No Issues
South Coast Air Quality District	February 25, 2009	Request to review AQ study
March Air Reserve Base	March 3, 2009	Verify project site and AICUZ
Riverside County Flood Control	March 12, 2009	District Master Plan Facilities
March JPA	March 18, 2009	AICUZ & Avigation Easement

Staff has coordinated with the responsible agencies listed above and where applicable, conditions of approval have been included to address concerns from the responding agencies.

STAFF RECOMMENDATION

Staff recommends that the Planning Commission take the following actions:

1. **APPROVE** Resolution No. 2012-016 **and CERTIFY** that the Environmental Impact Report (EIR) for the VIP Moreno Valley Project has been completed in compliance with the California Environmental Quality Act; and

2. **APPROVE** Resolution No. 2012-17 **APPROVING** Plot Plan PA09-0004 and Tentative Parcel Map 36162 (PA09-0012), subject to the attached conditions of approval included as Exhibits A and B.

Notice of
PUBLIC HEARING

This may affect your property. Please read.

Notice is hereby given that a Public Hearing will be held by the Planning Commission of the City of Moreno Valley on the following item(s):

CASE: PA09-0004 – Plot Plan
PA09-0012 – Tentative Parcel Map No. 36162
P11-020 – Environmental Impact Report

APPLICANT: Vogel Engineers, Inc.

OWNER: Vogel Engineers, Inc.

REPRESENTATIVE: RKZ, Inc.

LOCATION: Moreno Valley Industrial Area Plan (SP 208), south side of Grove View Road between Perris Boulevard and Indian Street at the City's southern boundary.

PROPOSAL: Plot Plan for a 1,616,133 square foot warehouse distribution building to be developed on approximately 80 acres. The building includes 268 dock high doors and 44,000 square feet of office area in four potential office locations. The project is located at the City's southern boundary on the north side of the Perris storm channel. Water quality features include five sandfilter basins and an infiltration swale. Tentative Parcel Map No. 36162 proposes to combine four existing parcels into a single 80 acre parcel for development of the project. An Environmental Impact Report has been prepared for the project.

ENVIRONMENTAL DETERMINATION: Environmental Impact Report

COUNCIL DISTRICT: 4

Any person interested in any listed proposal can contact the Community & Economic Development Department, Planning Division, at 14177 Frederick St., Moreno Valley, California, during normal business hours (7:30 a.m. to 5:30 p.m., Monday through Thursday) or may telephone (951) 413-3206 for further information. The associated documents will be available for public inspection at the above address.

In the case of Public Hearing items, any person may also appear and be heard in support of or opposition to the project or recommendation of adoption of the Environmental Determination at the time of the Hearing.

The Planning Commission, at the Hearing or during deliberations, could approve changes or alternatives to the proposal.

If you challenge any of these items in court, you may be limited to raising only those items you or someone else raised at the Public Hearing described in this notice, or in written correspondence delivered to the Planning Commission at, or prior to, the Public Hearing.

RESOLUTION NO. 2012-16

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF MORENO VALLEY, CALIFORNIA, CERTIFYING THE FINAL ENVIRONMENTAL IMPACT REPORT (P11-020), ADOPTION OF THE FINDINGS AND STATEMENT OF OVERRIDING CONSIDERATIONS, AND APPROVAL OF THE MITIGATION MONITORING PROGRAM FOR THE VIP MORENO VALLEY PROJECT, GENERALLY LOCATED IN THE MORENO VALLEY INDUSTRIAL AREA PLAN (SP 208), ON THE SOUTH SIDE OF GROVE VIEW ROAD BETWEEN PERRIS BOULEVARD AND INDIAN STREET AT THE CITY'S SOUTHERN BOUNDARY.

WHEREAS, on July 12, 2012, the Planning Commission of the City of Moreno Valley held a public hearing to consider the Environmental Impact Report and all related environmental documentation for the proposed project, which includes a Plot Plan for a 1,616,133 square foot distribution warehouse facility on approximately 80 acres. The warehouse building includes 268 dock doors and and 44,000 square feet of office area in four potential office locations. The project is located at the City's southern boundary on the north side of the Perris storm channel. Water quality features include five sandfilter basins and an infiltration swale. Tentative Parcel Map No. 36162 proposes to combine four existing parcels into a single 80 acre parcel for development of the project;

WHEREAS, the project includes applications for a plot plan (PA09-0004) and a tentative parcel map (PA09-0012). All the applications are related but shall not be approved unless the Environmental Impact Report (P11-020) is certified and approved.

WHEREAS, a Draft Environmental Impact Report (DEIR) was initially prepared for this project. Said DEIR was initially circulated for review on April 20, 2012, while the review period ended on June 4, 2012. A Final EIR, (including the Draft EIR and responses to comments), has been completed and is being recommended for certification, prior to the approval of discretionary permits related to the project.

WHEREAS, on June 29, 2012, the City published a notice in the local newspaper (Press Enterprise) and distributed copies of the Final EIR with complete responses to comments to the State Clearinghouse, local agencies and other interested parties;

WHEREAS, on July 12, 2012, the Planning Commission held a public hearing to consider a Final EIR for this project.

WHEREAS on July 12, 2012, the Planning Commission reviewed in full the Final EIR, the Statement of Overriding Considerations and Mitigation Monitoring Program;

WHEREAS, the draft and final EIR concerning the proposed VIP Moreno Valley Project were prepared in sufficient detail and duly circulated in compliance with the California Environmental Quality Act (CEQA), the State CEQA Guidelines and the City of Moreno Valley Rules and Procedures to Implement CEQA;

ATTACHMENT 2

MV00169938

WHEREAS, the Final EIR recommended to the City Council includes all responses to comments thereon;

WHEREAS, the Final EIR includes a review of potential impacts associated with the implementation of the VIP Moreno Valley Project, including, but not limited to agricultural resources, air quality, climate change and traffic;

WHEREAS, a Mitigation Monitoring Program has been completed to ensure that all of the mitigation measures outlined in the Final EIR are implemented, and

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

NOW, THEREFORE, the Planning Commission of the City of Moreno Valley does hereby resolve as follows:

1. The Planning Commission certifies that the Final Environmental Impact Report (EIR) for the VIP Moreno Valley Project on file with the Community & Economic Development Department, incorporated herein by this reference, has been completed in compliance with the California Environmental Quality Act, that the Planning Commission reviewed and considered the information contained in the Final EIR and that the Final EIR reflects the City's independent judgment and analysis; and

2. The Planning Commission hereby adopts the Findings and Statement of Overriding Considerations regarding the Final EIR for the VIP Moreno Valley Project, attached hereto as Exhibit A; and

3. The Planning Commission hereby approves the Mitigation Monitoring Program for the Final EIR for the proposed VIP Moreno Valley Project, attached hereto as Exhibit B.

Facts, Findings and Statement of Overriding Considerations
Regarding the Environmental Effects and the Approval of the
VIP Moreno Valley Project
(State Clearinghouse No. 2011081084)

I. INTRODUCTION

The Planning Commission of Moreno Valley (this "Commission"), in certifying the EIR for the VIP Moreno Valley Project and approving Tentative Parcel Map 36162 and a Site Plan authorizing the construction of up to approximately 1,616,133 square feet of distribution warehouse space (the "Project"), makes the Findings described below and adopts the Statement of Overriding Considerations presented at the end of the Findings. The Environmental Impact Report ("EIR") was prepared by the City acting as lead agency pursuant to the California Environmental Quality Act ("CEQA"). Hereafter, unless specifically identified, the Notice of Preparation ("NOP"), Notice of Availability & Completion ("NOA/NOC"), Draft EIR ("DEIR"), Technical Studies, Final EIR containing Responses to Comments and textual revisions to the Draft EIR ("FEIR"), and the Mitigation Monitoring and Reporting Program ("MMRP") will be referred to collectively herein as the "EIR." These Findings are based on the entire record before this Commission, including the EIR. This Commission adopts the facts and analyses in the EIR, which are summarized below for convenience. The omission of some detail or aspect of the EIR does not mean that it has been rejected by this Commission.

II. PROJECT SUMMARY

A. PROJECT DESCRIPTION

1. Site Location

The Project is located in the southwest portion of the City of Moreno Valley. The Project site consists of four parcels totaling approximately 71 net acres located on the southwest corner of Perris Boulevard and Grove View Road. The Perris Valley Storm Drain Lateral B channel forms the southern boundary of the site while Indian Street forms the western boundary. The site is located approximately 1.3 miles east of I-215, 4.5 miles south of SR-60, and 1.75 miles west of Lake Perris. March Air Reserve Base is located approximately one half mile west of the Project site.

The Project site is currently vacant, consisting of gently sloping land that has been used historically for agricultural purposes but currently lies fallow. It was most recently used as a sod farm that ceased operating in August 2005. The major roads that provide access to the Project site are Perris Boulevard, Indian Street, Grove View Road, and Harley Knox Boulevard, with the nearest I-215 interchanges at Harley Knox Boulevard and Ramona Expressway.

2. Project Description

The proposed Project would result in the construction and operation of approximately 1,616,133 square feet of distribution warehouse space on an approximately 71 acre site. The single building will be constructed with 264 vertical-lift dock-high roll up doors on the long (north and south) sides of the building to allow access for the loading and unloading of products from diesel truck/trailers. Building interiors are typically large and open to accommodate the temporary storage of the products to be distributed. The building will include a total of approximately 44,000 square feet of business office space for the management of the warehouse. Parking at the warehouse will be provided for 368 truck trucks and trailers as well as 589 parking stalls for passenger vehicles in accordance with City standards for light industrial uses.

The Project site is currently designated Business Park/Light Industrial in the City's General Plan. The site is zoned Industrial (I) in the Moreno Valley Industrial Area Plan (SP 208), which was originally adopted in 1989, and amended in 2001 and 2002. The proposed high-cube logistics warehouse project is consistent with the existing General Plan land use and zoning for the site.

3. Actions Covered by the EIR

The EIR will support the following discretionary approvals:

- Tentative Parcel Map approval (PM 36162);
- Certification of the Project EIR
- Approval of the Site Plan Review

Other non-discretionary actions

- Approval of a Storm Water Pollution Prevention Plan (SWPPP)

MV00169942

- Approval of a Water Quality Management Plan (WQMP)
- Issuance of a Grading permit, final drainage study, Final WQMP, and obtaining an NOI and WDID number.
- Issuance of an Encroachment permit
- Issuance of a Building permit

Approvals and permits required by other agencies include:

- A National Pollutant Discharge Elimination System (NPDES) permit
- Approval of water and sewer improvement plans by the Eastern Municipal Water District.
- Approval from the City and Riverside County Flood Control and Water Conservation District to ensure that construction site drainage velocities are equal to or less than the pre-construction conditions.

B. PROJECT OBJECTIVES

The Project Objectives include the following:

- Create employment-generating opportunities for the citizens of Moreno Valley and surrounding communities
- Encourage industrial development and minimize conflicts with the surrounding existing uses
- Encourage warehouse distribution services that take advantage of the area's close proximity to various freeways and transportation corridors
- Provide the infrastructure improvements required to meet Project needs in an efficient and cost-effective manner
- Encourage new development consistent with the capacity and municipal service capabilities

MV00169943

- Provide a high density, high-quality large-scale industrial development to provide jobs for residents at a variety of income levels
- Facilitate the efficient and cost-effective movement of goods in and through the City, which, in turn, allows the City to compete economically on a domestic and international scale
- Provide an industrial warehouse facility that meets the substantial and unmet demands of businesses located in the City and County
- Cluster industrial warehouse uses near efficient access points to the state highway system to reduce traffic congestion on surface streets and to reduce associated air pollutant emissions from vehicle sources
- Implement the City's General Plan Industrial/Business Park Land Use designations that are applicable to the site
- Accommodate new development that channels land uses in a phased, orderly manner and is coordinated with the provision of necessary infrastructure and public improvements;
- Provide new development that will assist the City in obtaining fiscal balance in the years ahead
- Address community circulation, both vehicular and pedestrian, utilizing available capacity within the existing circulation system, and provide fair share improvements to various future-year deficient intersections or road segments

III. ENVIRONMENTAL REVIEW AND PUBLIC PARTICIPATION

The City has conducted an extensive review of this Project which included the DEIR, FEIR and supporting technical studies, along with a public review and comment period first during the circulation of the NOP/Initial Study and then through the circulation of the DEIR. The following is a summary of the environmental review of this Project:

- On August 26, 2011, the City circulated a Notice of Preparation ("NOP") and the Initial Study that identified the environmental issues that the City anticipated would

MV00169944

be analyzed in the Project's DEIR to the State Clearinghouse, responsible agencies, and other interested parties.

- On September 19, 2011, the City conducted a public scoping meeting to allow members of the public to provide comments and input regarding the scope and content of the DEIR.

- The NOP public review period ran for 30 days, from August 26, 2011 to September 26, 2011. Written comments on the NOP were received from 12 different agencies, organizations, and individuals. The scope of the issues identified in the comments expressing concern included potential impacts associated with: Air Quality, Alternatives Analysis, Biological Resources, Cultural Resources/Sacred Sites, Greenhouse Gas Emissions/Global Climate Change, Hazardous Materials/Contamination, Traffic, and Water Availability and Quality.

- Based on the Initial Study, included in the DEIR in Appendix A, and comments received pursuant to the NOP, it was determined that some issues need not be addressed in depth in the DEIR because previous studies of other analyses provided sufficient information, analysis, and mitigation to conclude that there was little or no potential for significant impacts. These environmental topics included: (1) Aesthetics; (2) Biological Resources; (3) Cultural Resources; (4) Geology and Soils; (5) Hazards and Hazardous Materials; (6) Hydrology and Water Quality; (7) Land Use Planning; (8) Mineral Resources; (9) Population/Housing; (10) Public Services; (11) Recreation; and, (12) Utilities and Service Systems.

- On April 20, 2012, the NOA/NOC was filed with the Riverside County Recorder and the State Clearinghouse and the DEIR was circulated for the 45 day public review, which ended June 4, 2012.

- The City received a total of seven (7) comment letters from public agencies; one (1) from a community organization; and two (2) from individuals. The City prepared specific responses to all comments. The responses to comments are included in Section 3.0 of the FEIR.

- On June 28, 2012 in accordance with *Public Resources Code* Section 21092.5, the City provided written responses to public agencies that commented on the DEIR.

MV00169945

- On June 29, 2012, Notice of the Planning Commission hearing to consider the Project was provided in the following newspaper(s) of general and/or regional circulation: Press Enterprise.

- On July 12, 20012, this Commission held a public hearing to consider the Project and staff recommendations. The City, after considering written comments and oral testimony on the EIR, determined that no new information was presented that would require recirculation of the EIR. Following public testimony, submission of additional written comments, and staff recommendations, this Commission certified the EIR, adopted these Facts, Findings and the Statement of Overriding Considerations, and the further recommendations in the Staff Report, and approved the Project, including the PM 36162 (collectively the "Approvals").

IV. INDEPENDENT JUDGMENT FINDING

The Applicant retained the independent consulting firm of LSA Associates, Inc. to prepare the EIR for the Project. LSA Associates has prepared the EIR under the supervision, direction and review of the City with the assistance of an independent peer review (Michael Brandman Associates). The City of Moreno Valley is the Lead Agency for the preparation of the EIR, as defined by CEQA CPRC Section 21067 as amended. The Planning Commission has received and reviewed the EIR prior to certifying the EIR and prior to making any decision to approve or disapprove the Project.

Finding: The EIR for the Project reflects the City's independent judgment. The City has exercised independent judgment in accordance with *Public Resources Code* Section 21082.1(c) (3) in directing the consultant in the preparation of the EIR, as well as reviewing, analyzing and revising material prepared by the consultant.

A. GENERAL FINDING ON MITIGATION MEASURES

In preparing the Approvals for this Project, City staff incorporated the mitigation measures recommended in the EIR as applicable to the Project. In the event that the Approvals do not use the exact wording of the mitigation measures recommended in the EIR, in each such instance, the adopted Approvals are intended to be identical or substantially similar to the recommended

MV00169946

mitigation measure. Any minor revisions were made for the purpose of improving clarity or to better define the intended purpose.

Finding: Unless specifically stated to the contrary in these findings, it is this Commission's intent to adopt all mitigation measures recommended by the EIR which are applicable to the Project. If a measure has, through error, been omitted from the Approvals or from these Findings, and that measure is not specifically reflected in these Findings, that measure shall be deemed to be adopted pursuant to this paragraph. In addition, unless specifically stated to the contrary in these Findings, all Approvals repeating or rewording mitigation measures recommended in the EIR are intended to be substantially similar to the mitigation measures recommended in the EIR and are found to be equally effective in avoiding or lessening the identified environmental impact. In each instance, the Approvals contain the final wording for the mitigation measures.

V. ENVIRONMENTAL IMPACTS AND FINDINGS

City staff reports, the EIR, written and oral testimony at public meetings or hearings, these facts, findings and statement of overriding considerations, and other information in the administrative record, serve as the basis for the City's environmental determination.

The detailed analysis of potentially significant environmental impacts and proposed mitigation measures for the Project is presented in Section 2.0 and 2.0 of the DEIR and Section 3.0 of the FEIR. Responses to comments on the DEIR, along with copies of the comments, are provided in Chapter 2.0 of the FEIR.

The EIR evaluated five major environmental categories for potential impacts including Agricultural Resources, Air Quality, Climate Change and GHGs, Noise, and Transportation. Both Project-specific and cumulative impacts were evaluated. Of these five major environmental categories, this Commission concurs with the conclusions in the EIR that the issues and sub issues discussed in Sections V.A and V. B below either are less-than-significant without mitigation or can be mitigated below a level of significance. For the remaining potential environmental impacts that cannot feasibly be mitigated below a level of significance discussed in Section V.C, overriding considerations exist which make these potential impacts acceptable to this Commission.

MV00169947

A. LESS-THAN-SIGNIFICANT ENVIRONMENTAL IMPACTS NOT REQUIRING MITIGATION

The Moreno Valley Planning Commission hereby finds that the following potential environmental impacts of the Project are less-than-significant and therefore do not require the imposition of mitigation measures.

1. Agricultural Resources

a. Conflict with existing zoning or a Williamson Act Contract

Potential Significant Impact: Whether the Project would conflict with existing zoning for agricultural use, or a Williamson Act contract.

Findings: Potential impacts of the Project related to conflicts with existing zoning or a Williamson Act Contract are discussed in detail in Section 4.1 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to existing zoning or Williamson Act will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: As identified in section 4.1 of the DEIR, the Moreno Valley General Plan policies and zoning designations support agriculture only as an interim use, and no land in the City is designated solely for agricultural use or for agricultural preservation. The uses proposed for the Project site are consistent with the existing underlying General Plan and Zoning designations. The Project site is not zoned for agricultural uses. No impact would occur and no mitigation is required.

b. Conflict with/Loss of Existing Forest Land or Timberland Zoning

Potential Significant Impact: Whether the Project would conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)), and whether the Project would result in the loss of forest land or conversion of forest land to non-forest uses.

Findings: Potential impacts of the Project related to conflict with/loss of existing forest land or timberland zoning are discussed in detail in Section 4.1 of the DEIR. Based on the entire record

MV00169948

before us, this Commission finds that no significant impacts related to loss of forest or timberland will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: Section 4.1 identifies no forest or timberland resources located within the Project site nor is the Project site zoned for forest land or timberland. Implementation of the proposed Project would not require any rezoning or General Plan Amendments as the proposed uses are consistent with the existing underlying General Plan land use designation and zoning designation. The proposed Project would not conflict with existing forest zoning, cause rezoning of forest land, or result in the loss or conversion of forest lands to non-forest uses as no such resources exist in the City. No impacts associated with this issue would occur and no mitigation is required.

2. Air Quality

a. Air Quality Management Plan Consistency

Potential Significant Impact: Whether the Project would conflict with or obstruct implementation of the applicable air quality plan.

Findings: Potential impacts of the Project related to the applicable air quality plan are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts related to inconsistencies with the applicable air quality plan and, therefore, no mitigation is required.

Facts in Support of the Findings: The Project is consistent with, and will not impede or otherwise conflict with implementation of the Air Quality Management Plan ("AQMP"). The Project is consistent with AQMP Consistency Criterion No. 1 because it will not cause a potential increase in the frequency or severity of existing air quality violations or cause or contribute to new violations, or delay the timely attainment of air quality standards or the interim emissions reductions specified in the AQMP. The Project will not exceed the California Ambient Air Quality Standards ("CAAQS") for localized criteria pollutants during construction operations. While operational emissions will be generated in excess of SCAQMD"s regional threshold criteria (DEIR, pg. 4.2-26), these emissions are already accounted for in the AQMP since the Project is consistent with the land uses and development intensities reflected in the City General Plan and incorporated in the adopted AQMP. Consistent with intent and provisions of the AQMP, the Project will implement all feasible mitigation, and comply with all applicable SCAQMD rules developed to reduce air pollutant emissions. The Project is also consistent with AQMP Consistency Criterion No. 2 because the extent

MV00169949

of air pollutant emissions generated by the Project would be no greater than is reflected in the current General Plan and incorporated in the adopted AQMP. Because the Project is consistent with the General Plan Land Use designation of Business Park/Light Industrial, it does not exceed growth projections contained in the City's General Plan, and is consistent with growth assumptions in the AQMP. (DEIR, pgs. 4.2-14 to 4.2-15) Accordingly, impacts related to consistency with the applicable air quality plan will be less-than-significant and no mitigation is required.

b. Objectionable Odors

Potential Significant Impact: Whether the Project would create objectionable odors affecting a substantial number of people.

Findings: Potential impacts of the Project related to objectionable odors are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts due to objectionable odors and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.2 of the DEIR, the Project does not propose land uses typically associated with emitting objectionable odors. Potential odors during Project construction may result from heavy equipment exhaust and the application of asphalt and architectural coatings. Standard construction requirements would minimize odor impacts from construction. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less-than-significant. Project-related operational odor sources such as vehicle exhaust and routine painting/ maintenance activities are typical of industrial/commercial activities and would be localized to the immediate Project vicinity, with little or no off-site effects. Accordingly, impacts related to objectionable odors will be less-than-significant and no mitigation is required. (DEIR, pg. 4.2-15)

c. Long-Term Microscale (CO Hot Spot) Emissions

Potential Significant Impact: Whether the proposed Project would violate any air quality standard or contribute substantially to an existing or projected air quality violation. For CO, the applicable thresholds are:

- California State one-hour CO standard of 20.0 ppm; and

MV00169950

- California State eight-hour CO standard of 9.0 ppm.

Findings: Potential impacts of the Project related to long-term microscale emissions are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts related to long-term microscale emissions and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.2 of the DEIR, the highest one-hour CO concentration experienced at any of the intersections in the Project vicinity would not exceed the one hour CO State standard of 20 ppm. Based on the *Air Quality Analysis* prepared for the proposed Project, the proposed Project would contribute, at most, a 0.2 ppm increase to the one-hour CO concentrations for all scenarios. This is below the 1.0 ppm increase threshold. Also the highest eight-hour CO concentration experienced at any of the intersections in the Project vicinity would not exceed the eight-hour CO state standard of 35 ppm. Based on the Air Quality Analysis prepared for the proposed Project, the proposed Project would contribute, at most, a 0.2 ppm increase to the eight-hour CO concentrations for all scenarios. This is below the 0.45 ppm increase threshold. Since the proposed Project would not exceed the one-hour or eight-hour CO concentration standards, it is reasonable to conclude that no CO hot spots would occur. Therefore, the proposed Project would not have a significant impact on local air quality for CO and no mitigation measures would be required. (DEIR, pgs. 4.2-15 to 4.2-17)

d. Localized Operational Emissions

Potential Significant Impact: Whether the proposed Project would violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants.

For long-term operation, the applicable localized daily thresholds are:

- 12,083 pounds per day of CO;
- 585 pounds per day of NOX;
- 32 pounds per day of PM10; and
- 14 pounds per day of PM2.5.

Findings: Potential impacts of the Project related to localized operational emissions are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that

MV00169951

development of the Project will not result in significant impacts related to localized operational emissions and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.2 of the DEIR, the operational emissions rates of NO_X, CO, PM_{10}, and $PM_{2.5}$ are less than 10 percent of the LST thresholds for the applicable pollutant. None of the criteria pollutant emissions would exceed localized thresholds during the operation of the proposed Project. Therefore, the proposed Project would not have a significant impact on localized operational pollutant levels and no mitigation measures would be required. (DEIR, pgs. 4.2-15 to 4.2-17)

e. Operational-Acute Health Risk

Potential Significant Impact: Whether the proposed Project would expose sensitive receptors to substantial pollutant concentrations.

Findings: Potential impacts of the Project related to operational-acute health risks are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts related to operational-acute health risks and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.2 of the DEIR, exposure to diesel exhaust can have immediate health effects, such as irritation of the eyes, nose, throat, and lungs, and it can cause coughs, headaches, light headedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. However, according to the rulemaking on *Identifying Particulate Emissions from Diesel-Fueled Engines as a Toxic Air Contaminant* (ARB 1998), the available data from studies of humans exposed to diesel exhaust are not sufficient for deriving an acute non-cancer health risk guidance value. While the lung is a major target organ for diesel exhaust, studies of the gross respiratory effects of diesel exhaust in exposed workers have not provided sufficient exposure information to establish a short-term non-cancer health risk guidance value for respiratory effects. Therefore, the potential for short-term acute exposure from diesel exhaust are considered to be less than significant and no mitigation is required. (DEIR, pg. 4.2-18)

MV00169952

f. Operational-Chronic Health Risk

Potential Significant Impact: Whether the proposed Project would expose sensitive receptors to substantial pollutant concentrations.

For Maximum Individual Cancer Risk, the applicable thresholds are:

- An increased cancer risk greater than 10 in 1 million (1.0×10^{-5}) at any receptor location; or

For non-cancer chronic hazard indices (HI); the applicable threshold is:

- A cumulative increase for any target organ system exceeding 1.0 at any receptor location.

Findings: Potential impacts of the Project related to operational-chronic health risks are discussed in detail in Section 4.2 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts related to operational-chronic health risks and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.2 of the DEIR, a screening level health risk assessment was performed for the operational emissions associated with the proposed Project based on the SCAQMD's *Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis* guidance. The operations expected to occur at this facility will not emit any toxic chemicals in any significant quantity other than vehicle exhaust. While there may be other toxic substances in use on site, compliance with state and federal handling regulations will bring emissions to below a level of significance. The nearest residences would experience a cancer risk of 6.6 in 1 million, which is below the 10 in 1 million threshold. The nearest residences would also experience a chronic hazard index of 0.0041, which is below the 1.0 threshold. The peak off-site worker cancer risk level is 4.5 in a million, which is also below the 10 in 1 million threshold. Chronic hazard index for the peak off-site worker would be 0.0029, which is below the 1.0 threshold. Since the operational phase of the proposed Project would not exceed any of the operational related health risk assessment thresholds, a less than significant impact would occur and no mitigation is required. (EIR, pgs. 4.2-18 to 4.2-19)

MV00169953

3. Climate Change and Greenhouse Gas Emissions

a. Greenhouse Gas Plan, Policy, Regulation Consistency

Potential Significant Impact: Whether the proposed Project would conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases.

Findings: Potential impacts of the Project related to greenhouse gas plan, policy, and regulation consistency are discussed in detail in Section 4.3 of the DEIR. Based on the entire record before us, this Commission finds that development of the Project will not result in significant impacts related to greenhouse gas plan, policy, or regulation consistency and, therefore, no mitigation is required.

Facts in Support of the Findings: The proposed Project would implement appropriate GHG reduction strategies and would ensure that it does not conflict with or impede implementation of reduction goals identified in AB 32, Governor's Executive Order S-3-05, and other strategies to help reduce GHGs to the level proposed by the Governor. In addition, the Project would also be subject to all applicable regulatory requirements, which would also reduce the GHG emissions of the Project. Therefore, the proposed Project would not conflict with any applicable plan, program, policy, or regulation related to the reduction of GHG emissions resulting in a less than significant impact. (DEIR, pgs. 4.3-16 to 4.2-21)

4. Noise

a. Airport Noise

Potential Significant Impacts: Whether a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would results in exposure of people residing or working in the project area to excessive noise levels. Or if a project within the vicinity of a private airstrip, would expose people residing or working in the project area to excessive noise levels.

Findings: Potential impacts of the Project relating to airport noise are discussed in detail in Section 4.4 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to airport noise will occur as a result of development of the Project and, therefore, no mitigation is required.

MV00169954

Facts in Support of the Findings: According to Section 4.4 of the DEIR, the nearest airport is the March Air Reserve Base, which is located approximately 0.75 mile northwest of the Project site. The proposed Project is not identified as being within the noise or safety contours delineated for the March Air Reserve Base Airport. While the proposed Project is located within two miles of a public airport, the proposed Project would not have the potential to expose people working on the Project site to excessive noise levels from airport operations as the Project site is located outside of the noise and safety contours of March Air Reserve Base. A less than significant impact would occur with implementation of the proposed Project. Additionally, the proposed Project site is not located within the vicinity of a private airstrip; therefore, no impact associated with this issue would occur and no mitigation is required. (DEIR, pgs. 4.4-9 to 4.4-10)

b. Ground-Borne Vibrations

Potential Significant Impact: Whether the Project would result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels.

Findings: Potential impacts of the Project relating groundborne vibration and groundborne noise are discussed in detail in Section 4.4 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to ground-borne vibration and groundborne noise will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.4 of the DEIR, the Project does not propose activities or uses that would result in long-term substantial or even perceptible vibration levels. The Project site is not located near steel-wheeled trains. Additionally, roadways in the project area are either paved or would be paved and would not result in traffic driving over rough roads. Construction activities for the project site do not include blasting or pile driving. The primary vibratory source during the construction of the proposed Project would be large bulldozers. Based on published data, typical bulldozer activities generate an approximate vibration level of 0.089 in/sec at a distance of 25 feet. At the distance of the nearest residence to the project boundary (approximately 1,000 feet) the estimated vibration level would not be discernible. While heavy-duty earthmoving equipment would be used during the construction phase of the project, the level of vibration would not be excessive or permanent, nor would it exceed the level at which building damage typically occurs. Therefore, impacts from construction-related groundborne vibration construction would be less than significant and no mitigation is required. (DEIR, pg. 4.4-10)

MV00169955

c. Long-Term Traffic Noise

Potential Significant Impact: Whether the project would result in a substantial temporary, periodic, and/or permanent increase in ambient noise levels in the project vicinity above levels existing without the project.

Findings: Potential impacts of the Project related to long-term noise are discussed in detail in Section 4.4 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to long-term noise will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.4 of the DEIR, project-related traffic noise level increases would be 0.8 dBA or less along all roadway segments analyzed. Noise level increases within this range are small and are not perceptible by the human ear. Therefore, no significant traffic noise impacts would occur to off-site land uses with implementation of the proposed Project. Also the proposed warehouse distribution center uses are not impacted by the 75 dBA CNEL noise contour from Indian Street (within 50 feet of the roadway centerline), Oleander Avenue (within 50 feet of the roadway centerline), or Perris Boulevard (98 feet from the roadway centerline). Therefore, noise levels at the on-site uses are below the City's 75 dBA CNEL noise standard for industrial uses. No significant noise impacts to on-site industrial uses would occur and no mitigation measures are required. (DEIR, pgs. 4.4-10 to 4.4-13)

d. Long-Term Operational Noise

Potential Significant Impact: Whether the project would cause exposure of persons to or generation of noise levels in excess of standards established in the City of Moreno Valley General Plan, Moreno Valley Municipal Code, or applicable standards of other agencies.

Findings: Potential impacts of the Project related to long-term operational noise are discussed in detail in Section 4.4 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to long-term operational noise will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: The nearest existing sensitive receptors in the vicinity of the project site are rural residential uses located along Nandina Avenue approximately 1,000 feet north of the project boundary. There are also nonconforming residential dwelling units within commercial and industrial uses on property zoned for commercial or industrial uses approximately 0.5 mile

MV00169956

southwest of the project site on the south side of Oleander Avenue between Heacock Street and Patterson Avenue.

The warehouse distribution use has loading docks on the north and south sides of the building, approximately 1,000 feet from the existing residences to the north. Noise associated with loading/unloading activities would potentially affect these existing residential uses. Other on-site, noise-producing activities may include traffic and activity within the parking lot (load talking, horn blowing, vehicle door slamming, truck idling, etc.). Although individual activity may generate relatively high and intermittent noise, when added to the typically lower ambient noise and averaged over a longer period of time, the cumulative noise level would be much lower and would be considered a less than significant impact. (DEIR, pg. 4.4-14)

The project would have rooftop heating, ventilating, and air conditioning (HVAC) equipment, as well as ground floor garbage compactors. Rooftop HVAC units generate noise levels of approximately 62 dBA at 50 feet. The closest noise-sensitive land uses are existing residences which are located approximately 1,000 feet to the north from the nearest potential on-site rooftop HVAC equipment location. With the effect of distance divergence, noise generated by HVAC equipment would be reduced by 26 dBA at the closest residences when compared with the noise level measured at 50 feet. Additionally, the roof edge (parapet) creates a noise barrier that reduces noise levels from rooftop HVAC units by an additional 3 to 5 dBA or more for ground floor receptors. Because of the attenuation achieved, nearest residences located to the north of the project site would be exposed to an exterior noise level of 33 dBA L_{max} or lower. This range of noise levels is substantially lower than traffic noise on roadways in the project vicinity and the truck movement and loading/unloading noise. Therefore, because the City's exterior noise standard of 60 dBA L_{dn}/CNEL for HVAC equipment in residential district (Planning and Zoning Code, Chapter 9.03.040) would not be exceeded at the nearest sensitive noise receptors, no significant noise impact resulting from the operation of rooftop HVAC equipment would occur and no mitigation is required. (DEIR, pg. 4.4-15)

Garbage compactors generate approximately 70 dBA L_{max} at 6 feet. With the effect of distance divergence, noise generated by garbage compactors would be reduced to 26 dBA L_{max} or lower at the closest residences. Because the City's exterior noise standard of 60 dBA L_{max} during the day and 55 dBA L_{max} during the night would not be exceeded, no significant noise impacts from the on-site garbage compactors would occur. In the absence of any significant impact, no mitigation is required. (DEIR, pg. 4.4-15)

MV00169957

It is anticipated that the proposed uses would have some sort of speaker system at the truck loading docks. Typical loud speakers generate a sound level of 75 dBA L_{max} at 50 feet. With the distance attenuation of 26 dBA the speaker noise at the nearest residences will be at or below 49 dBA L_{max}. This range of maximum noise levels is lower than the City's nighttime exterior noise standards of 55 dBA L_{max} standard. Therefore, noise associated with loading dock speakers at the proposed warehouse buildings would not result in noise levels exceeding the typical daytime or nighttime noise standards at the nearest residences to the southeast and no mitigation measures are required. (DEIR, pg. 4.4-15)

The typical maximum allowable interior noise levels for residential uses are 45 dBA between 10:01 p.m. and 7:59 a.m. and 50 dBA between 8:00 a.m. and 10:00 p.m. Typical southern California homes with windows open would achieve up to 12 dBA in exterior to interior noise reduction. When windows are closed, the noise attenuation increases to 24 dBA. Additionally, distance divergence of 1,000 feet provides 26 dBA of noise attenuation. Interior noise levels at the nearest residential homes to the north, attributable to loading/unloading activities from the nearest on-site loading areas, would be reduced to 37 dBA L_{max} with windows open and to 25 dBA L_{max} with windows closed. This range of noise level is compatible with or lower than typical household activity noise. Therefore, no significant interior noise impacts for the nearest sensitive receptors would occur and no mitigation is required. (DEIR, pg. 4.4-16)

5. Transportation

a. Design Features or Incompatible Uses

Potential Significant Impact: Whether the Project would substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Findings: Potential impacts of the Project related to design features or incompatible uses are discussed in detail in Section 4.5 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to the design features or incompatible uses will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.5 of the DEIR, the design of roadways must provide adequate sight distance and traffic control measures. This provision is normally realized through roadway design to facilitate roadway traffic flows. Roadway improvements in and

MV00169958

around the Project site would be designed and constructed to satisfy all City requirements for street widths, corner radii, intersection control as well as incorporate design standards tailored specifically to site access requirements.

The final design of all roadways and intersections within the Project site access would be reviewed by a licensed professional civil engineer to ensure adequate safety when traveling to and from the Project site. The proposed Project does not include any sharp curves or dangerous intersections in its design. Adherence to applicable existing requirements of the City of Moreno Valley consistent with the City's Circulation Element Objectives 5.1 (create a safe, efficient, and neighborhood-friendly street system), 5.5 (maximize efficiency of the local circulation system by using appropriate policies and standards to design, locate, and size roadways), and 5.11 (eliminate obstructions that impede safe movement of vehicles, bicyclists, and pedestrians) and other agencies would reduce impacts associated with this issue to a less than significant level and no mitigation is required. (DEIR, pgs. 4.4-15 to 4.4-16)

b. Inadequate Emergency Access

Potential Significant Impact: Whether the proposed Project would result in inadequate emergency access.

Findings: Potential impacts of the Project related to inadequate emergency access are discussed in detail in Section 4.5 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to inadequate emergency access will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.5 of the DEIR, the developers of the proposed Project would be required to design, construct, and maintain structures, roadways, and facilities to provide for adequate emergency access and evacuation. Construction activities, which may temporarily restrict vehicular traffic, would be required to implement adequate and appropriate measures to facilitate the passage of persons and vehicles through/around any required road closures. The proposed Project design would be submitted to and approved by the City's Fire and Police Departments prior the issuance of building permits. Adherence to applicable existing requirements of the City of Moreno Valley and other agencies would reduce impacts associated with this issue to a less than significant level and no mitigation is required. (DEIR, pg. 4.4-16)

MV00169959

c. Alternative Transportation

Potential Significant Impact: Whether the proposed Project would conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities.

Findings: Potential impacts of the Project related to alternative transportation are discussed in detail in Section 4.5 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to alternative transportation will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.5 of the DEIR, the design of the Project would be required to adhere to applicable City of Moreno Valley standards that support and/or facilitate alternative modes of transportation, including but not limited to pedestrian pathways and sidewalks consistent with the City's Circulation Element Objective 5.8 (encourage development of an efficient public transportation system for the entire community). Through the City's project review process, policies, plans, and/or programs supporting alternative transportation would be reviewed and incorporated as applicable. Consequently, a less than significant impact would occur as a result of the proposed Project and no mitigation is required. (DEIR, pgs. 4.4-16 to 4.4-17)

d. Air Traffic Patterns

Potential Significant Impact: Whether the Project would increase or otherwise affect existing air traffic patterns.

Findings: Potential impacts of the Project related to air traffic patterns are discussed in detail in Section 4.5 of the DEIR. Based on the entire record before us, this Commission finds that no significant impacts related to any change in air traffic patterns will occur as a result of development of the Project and, therefore, no mitigation is required.

Facts in Support of the Findings: According to Section 4.5 of the DEIR, airport facilities within the vicinity of the Project site include the March Air Field, which is part of the March Air Reserve Base (MARB). The Project site is located approximately 0.75 mile east of March Air Field and is entirely within Airport Influence Area II. As part of the standard process for development within Airport Influence Areas for MARB, proposed Projects are required to be reviewed by the ALUC for consistency with the ALUP. As a standard condition imposed during ALUC reviews, developments located within the boundaries of Influence Area III are required to provide avigation easements. To

MV00169960

ensure consistency with the ALUC recommendations is maintained, avigation easements will be required as part of a condition of approval for the Project site. Development that would occur within Airport Influence II of MIP would not include any features that would alter air traffic patterns or the level of air traffic at the MIP; therefore, a less than significant air traffic safety impact would occur and no mitigation is required. (DEIR, pgs. 4.4-17 to 4.4-18)

B. ENVIRONMENTAL IMPACTS MITIGATED TO A LEVEL OF LESS-THAN-SIGNIFICANT

Public Resources Code Section 21081 states that no public agency shall approve or carry out a project for which an EIR has been completed which identifies one or more significant effects unless the public agency makes one or more of the following findings:

I. Changes or alterations have been required in, or incorporated into, the Project which mitigate or avoid the significant effects on the environment.

II. Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

III. Specific economic, legal, social, technological, or other considerations make infeasible the mitigation measures or alternatives identified in the EIR, and overriding economic, legal, social, technological, or other benefits of the Project outweigh the significant effects on the environment.

Certain of the following issues from the environmental categories analyzed in the EIR, including biological resources, paleontological resources, geology and soils, hydrology and water quality, noise (short-term construction), and transportation (local intersections and roadways) were found to be potentially significant, but can be mitigated to a less-than-significant level with the imposition of mitigation measures. This Commission hereby finds pursuant to *Public Resources Code* Section 21081 that all potentially significant impacts listed below can and will be mitigated to below a level of significance by imposition of the mitigation measures in the EIR; and that these mitigation measures are included as Conditions of Approval and set forth in the MMRP adopted by this Commission. Specific findings of this Commission for each category of such impacts are set forth in detail below.

MV00169961

1. Biological Resources

a. Adverse Effects to Sensitive or Special Status Species

Potential Significant Impact: The EIR evaluated and concluded that the Project could have an adverse effect on candidate, sensitive, or special status species.

Finding: Implementation of the following mitigation measures will reduce the potential adverse impacts to sensitive or special status species to less than significant:

Mitigation Measure BIO-1: *No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction survey shall be completed by a qualified biologist. The survey will identify special status avian species (if any) within the area of intended disturbance. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, Mitigation Measure BIO-3 shall apply.*

Mitigation Measure BIO-2: *No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction burrowing owl survey shall be completed by a qualified biologist for the planned disturbance area. The pre-construction burrowing owl surveys may be conducted as part of the survey required in Mitigation Measure BIO-1. A report detailing the findings of the pre-construction survey shall be submitted to the City prior to the initiation of ground-disturbing activities. In the event no burrowing owls are identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, Mitigation Measures BIO-3 and BIO-4 shall apply.*

Mitigation Measure BIO-3: *If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance, no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.*

MV00169962

Mitigation Measure BIO-4: *If active burrowing owl burrows are detected outside the breeding season, then passive and/or active relocation may be approved following consultation with the CDFG and/or USFWS. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure that animals do not re-enter the holes/dens.*

Facts in Support of the Finding: According to Section 2.5.2 of the DEIR, the site is characterized as a regularly disked field that supports little to no standing vegetation and is not located within a Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) Criteria Area. However, the site is located in an area that requires habitat assessments for burrowing owl, five Narrow Endemic Plant Species, and nine Criteria Area Plant Species in accordance with the MSHCP. During the habitat assessment surveys and focused surveys no sign of burrowing owls were observed. The Project site is not an optimal habitat for burrowing owl, but because burrowing owls have been known to occur on land that has been disturbed and is considered a mobile and opportunistic species, **Mitigation Measures BIO-1 through BIO-4** were taken to reduce the potential impact to less than significant. The five NEPS and nine CAPS were not observed during the general survey (February 2007) and focused surveys (May, June, and July 2009) conducted on site. Overall, the Project site lacks suitable habitat for these species due to historic agricultural activities. Nonetheless, focused surveys were conducted to cover the four depressed areas and the ditch. No special status plants were observed during the focused surveys. Because of the absence of members of the species and suitable habitat, a less than significant impact to other special status plants would occur. (DEIR, pg. 2-9)

2. <u>Cultural Resources</u>

a. Directly or Indirectly Destroy a Unique Paleontological Resource or Site or Unique Geologic Feature

Potential Significant Impact: The EIR evaluated and concluded that the Project could have an adverse effect on significant fossil resources.

Finding: Implementation of the following mitigation measures will reduce the impact to unique paleontological resources and site or unique geological features to less than significant:

MV00169963

Mitigation Measure CUL-1: *Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued. In the event fossiliferous deposits are encountered, the following measures shall be implemented:*

- *Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources.*

- *Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored.*

- *If too few fossil remains are found after 50 percent of the planned-for earthmoving has been completed, monitoring can be reduced or discontinued in those areas at the project paleontologist's direction.*

MV00169964

- *Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.*
- *Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities.*
- *Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources.*

Facts in Support of the Finding: Based on the paleontological resources analysis contained in Section 2.5.3 of the DEIR, the site has a high potential to contain significant fossil resources due to the presence of early to middle Pleistocene alluvial fan deposits. These resources have the potential for being unearthed and damaged during grading and construction activities and are estimated to lie at approximately 4 feet below ground surface. Construction and grading of the proposed Project site will result in soil disturbance below 4 feet, which may unearth previously undetected subsurface paleontological resources. **Mitigation Measure CUL-1** has been identified to reduce the significance of paleontological resource impacts. Adherence to this measure would reduce impacts to paleontological resources to a less than significant level. (DEIR, pgs. 2-12 to 2-13)

3. <u>Geology and Soils</u>

a. Unstable Soils

Potential Significant Impact: The EIR evaluated and concluded that the Project site could experience soil shrinkage during excavation and recompaction.

Finding: Implementation of the following mitigation measures will reduce the potential impact of lateral spreading, subsidence, and collapse to less than significant:

MV00169965

Mitigation Measure GEO-1: *Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure.*

The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site.

The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed.

The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be

MV00169966

placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm.

Facts in Support of the Finding: Section 2.5.4 of the DEIR included a geotechnical analysis that performed in-place soil density tests, which revealed that soil shrinkage that may occur would be approximately 10 percent to 15 percent due to excavation and recompaction. This is based on the assumption that the fill would be compacted to 90 percent of the dry density per ASTM standards. As a result subsidence is estimated at 0.2 feet due to earthwork operations. Impacts are considered potentially significant and mitigation measures are required. The geotechnical analysis determined that there is no potential for landslides or liquefaction. Additionally, potential impacts related to lateral spreading would be reduced to less than significant level through adherence to the UBC. **Mitigation Measure GEO-1** would reduce potential impacts associated with unstable soils to a less than significant level. (DEIR, pgs. 2-15 to 2-16)

b. Expansive Soils

Potential Significant Impact: The EIR evaluated and concluded that expansive soils could occur.

Finding: Implementation of the following mitigation measures will reduce to potential impact of expansive soils to less than significant:

Mitigation Measure GEO-2: *Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis. The recommendations identified in the project's Expansive Soil Guidelines shall be reviewed and considered by the project engineers, architects, owner, maintenance personnel, and other interested parties to determine applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans.*

Facts in Support of the Finding: According to Section 2.5.4 of the DEIR, soils on site include Exeter sandy loam, 0–2 percent slopes (EnA), Exeter sandy loam, deep (EpA), Exeter very fine

MV00169967

sandy loam (EwB), Exeter very fine sandy loam, deep (EyB), Greenfield sandy loam (GyA), Ramona sandy loam (RaA), Ramona very fine sandy loam (ReC2), and Travor loamy fine sand, eroded (Tp2). As detailed in the Project's geotechnical analysis, expansive soils were observed on the Project site. Exploratory trenches revealed the existing earth materials on site to consist of a disturbed soil/fill and natural soil. A fill/disturbed natural soil classifying as a brown, sandy to clayey silt to a silty sand was encountered across the site and ranged in depth from 1 foot to 1½ feet. These soils were noted to be soft to loose and damp. An undisturbed alluvium soil classifying as a brown sandy to clayey silt to a silty sand was encountered beneath the disturbed top soils and fill. These native soils were noted to be firm to stiff, medium dense to dense, and moist. Development of the proposed Project site would be required to adhere to UBC and City design and engineering standards. However, because expansive soils are present on site, impacts associated with this issue are potentially significant and mitigation measures are required. **Mitigation Measure GEO-2** would reduce potential impacts associated with expansive soils to a less than significant level. (DEIR, pgs. 2-16 to 2-17)

4. Hydrology and Water Quality

a. Water Quality Standards and Waste Discharge Requirements

Potential Significant Impact: The EIR evaluated and concluded that the Project could violate water quality or waste discharge requirements, substantially increase the rate of surface runoff causing flooding, create substantial additional sources of polluted runoff, or otherwise substantially degrade water quality.

Finding: Implementation of the following mitigation measures will reduce the potential impacts related to compliance with water quality standards and waste discharge requirements to less than significant:

Mitigation Measure HYD-01: *Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall provide evidence to the City that a Notice of Intent (NOI) with the Regional Water Quality Control Board has been filed to be covered under the State NPDES General Construction Permit for discharge of stormwater associated with construction activities.*

Mitigation Measure HYD-02: *Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall submit to the State Water*

MV00169968

Quality Control Board, a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. Additionally, the SWPPP shall identify structural and nonstructural BMPs to control sediment and non-visible discharges from the site. BMPs to be implemented in the SWPPP may include but shall not be limited to the following:

- *Sediment discharges from the site may be controlled by the following: gravel bags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs will be periodically inspected during construction, and repairs will be made when necessary as required by the SWPPP.*
- *Materials that have the potential to contribute non-visible pollutants to stormwater must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas.*
- *All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate any discharge from the site. Stockpiles will be surrounded by silt fences.*
- *The SWPPP will include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance.*
- *Additional BMPs and erosion control measures will be documented in the SWPPP and utilized if necessary.*
- *The SWPPP will be kept on site for the entire duration of project construction and will also be available to the local RWQCB for inspection at any time.*

MV00169969

In the event that it is not feasible to implement the above BMPs, the City of Moreno Valley can make a determination that other BMPs will provide equivalent or superior treatment either on or off site.

Mitigation Measure HYD-03: *Prior to the issuance of grading permits, the project proponent shall provide evidence to the City that the following provisions have been added to construction contracts for the project:*

- *The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the SWPPP. Weekly inspections shall be performed on sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and submitted to the City for inspection. In addition, the Contractor will also be required to maintain an inspection log and have the log on site to be reviewed by the City of Moreno Valley and the representatives of the Regional Water Quality Control Board.*

Mitigation Measure HYD-04: *Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley for a Final Water Quality Management Plan (F-WQMP). The F-WQMP shall specifically identify pollutants of concern, site design, source control, and treatment control BMPs that shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.*

Facts in Support of the Finding: According to Section 2.5.6 of the DEIR, development of the Project is required to obtain coverage under an NPDES permit, which includes the submittal of a Notice of Intent (NOI) application to the State Water Resources Control Board (SWRCB), the receipt of a Waste Discharge Identification Number (WDID) from SWRCB, and the preparation of an SWPPP for construction wastewater discharges. During the construction period, the Project would use a series of Best Management Practices (BMPs) to reduce erosion and sedimentation. These measures may include the use of gravel bags, silt fences, hay bales, check dams, hydroseed, and soil binders. The construction contractor would be required to operate and maintain these controls throughout the duration of on-site activities. In addition, the construction contractor would be

MV00169970

required to maintain an inspection log and have the log on site to be reviewed by the City and representatives of the RWQCB. Adherence to **Mitigation Measures HYD-01 through HYD-04** will ensure that these practices and measures take place and would reduce the potential impacts related to compliance with water quality standards and waste discharge requirements to less than significant. (DEIR, pgs. 2-19 to 2-24)

b. Erosion

Potential Significant Impact: The EIR evaluated and concluded that the Project could significantly alter drainage patterns that would result in erosion or siltation.

Finding: Implementation of the following mitigation measures will reduce the potential impacts to less than significant:

Mitigation Measure HYD-05: Prior to grading plan approval and the issuance of a grading permit, the project proponent shall submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed Project site are less than or equal to pre-development flows.

Facts in Support of the Finding: According to Section 2.5.6 of the DEIR, the majority of storm flows associated with the Project will be collected by a series of drop inlet catch basins. While the increase in impervious surfaces attributable to the proposed Project would contribute to a greater volume and higher velocity of storm water flows, the proposed Project's drainage system would accept and accommodate runoff that would result from Project construction at or below pre-Project conditions. Therefore, the post-development flows generated on the Project site would not exceed the capacity of the planned storm water drainage systems. To ensure that long-term drainage capacity issues are reduced to a less than significant level, **Mitigation Measure HYD-05** has been identified. With adherence to this mitigation measure, impacts associated with effects on existing drainage patterns are reduced to less than significant. (DEIR, pgs. 2-24 to 2-25)

MV00169971

5. Noise

a. Short-Term Construction Noise

Potential Significant Impact: The EIR evaluated and concluded that noise levels from grading and other construction activities for the proposed Project may range up to 65 dBA at the closest residences north of the Project site for very limited times when construction occurs near the Project's boundary. Construction-related noise impacts from the proposed Project would be potentially significant.

Finding: Implementation of the following mitigation measures will reduce potential short-term construction noise impacts to less than significant:

4.4.6.1A *During all project site excavation and grading on site, the project contractor shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers consistent with manufacturers' standards.*

4.4.6.1B *The project contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest to the project site.*

4.4.6.1C *The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receptors nearest to the project site during all project construction.*

4.4.6.1D *During all project site construction activities, the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer. For grading activity, the hours are limited to between 7:00 a.m. and 6:00 p.m. weekdays and 8:00 a.m. to 4:00 p.m. on weekends and holidays.*

Facts in Support of the Finding: According to Section 4.4 of the DEIR, two types of short-term noise impacts could occur during the construction of the Project. First, construction crew commutes and the transport of construction equipment and materials to the site for the proposed Project would incrementally increase noise levels on access roads leading to the site. The second type of short-term noise impact is related to noise generated during excavation, grading, and building erection on the

MV00169972

Project site. Construction of the proposed Project is expected to require the use of scrapers, bulldozers, and water and pickup trucks. The site preparation phase, which includes excavation and grading of the site, tends to generate the highest noise levels, because the noisiest construction equipment is earthmoving equipment. Earthmoving equipment includes excavating machinery such as backfillers, bulldozers, draglines, and front loaders. Earthmoving and compacting equipment includes compactors, scrapers, and graders. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. The maximum noise level generated by each scraper on the proposed Project site is assumed to be approximately 87 dBA L_{max} at 50 feet from the scraper. Each bulldozer would generate approximately 85 dBA Lmax at 50 feet. The maximum noise level generated by water and pickup trucks is approximately 86 dBA L_{max} at 50 feet from these vehicles. Each doubling of the sound sources with equal strength increases the noise level by three (3) dBA. Assuming that each piece of construction equipment operates at some distance from the other equipment, the worst-case composite noise level during this phase of construction would be 91 dBA L_{max} at a distance of 50 feet from the active construction area.

The nearest noise-sensitive receptor locations to the Project site are existing residences approximately 1,000 feet to the north. These nearest residents may be subject to short-term, intermittent, maximum noise reaching 65 dBA L_{max}, generated by construction activities on the project site. The ambient noise associated with vehicular traffic and industrial uses in the project area would mask the majority of the construction noise from the project site. No significant construction noise impacts would occur if construction of the proposed project would occur within the permitted hours of 6:00 a.m. to 8:00 p.m. of any working day, and within the permitted hours of 7:00 a.m. and 8:00 p.m. on Sundays and federal holidays. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures have been identified to reduce the noise levels that would expose nearby sensitive receptors to noise levels in excess of the City's noise standards.

With adherence to the City's designated construction hours and with implementation of the proposed mitigation measures, potential short-term construction noise impacts would be reduced below the level of significance. (DEIR, pgs. 4.4-16 to 4.4-18)

MV00169973

6. Transportation

a. Existing Plus Project Roadway Segments

Potential Significant Impact: The EIR evaluated and concluded that two roadway segments are forecasted to exceed satisfactory levels of service in the existing plus project conditions.

Finding: Implementation of the following mitigation measures will reduce project-specific roadway segment impacts to less than significant:

4.5.6.1A. *Prior to the issuance of building permits, the project applicant shall participate in the City of Moreno Valley Development Impact (DIF) Fee Program and pay the project's fair share for local circulation improvements as outlined in the VIP Moreno Valley Project Traffic Study. The City shall ensure that the intersection and street improvements outlined in the VIP Moreno Valley Project Traffic Study will be constructed pursuant to the timeframes established by the City of Moreno Valley Development Impact Fee Program.*

4.5.6.1B. *Prior to the issuance of building permits, the project applicant shall participate in the County of Riverside Transportation Uniform Mitigation Fee (TUMF) Program and pay the project's fair share for regional circulation improvements. The City shall ensure that the intersection and street improvements outlined in the VIP Moreno Valley Project Traffic Study will be constructed pursuant to the timeframe established by the County of Riverside TUMF Program.*

Facts in Support of the Finding: According to Section 4.5 of the DEIR, Perris Boulevard north of Grove View Road (southbound); and Perris Boulevard south of South Project Driveway (northbound and southbound) are projected to operate at unsatisfactory levels of service. The DEIR determined that this roadway currently operates at unsatisfactory levels of service without the projected conditions. The City is currently in the process of implementing a Capital Improvement Project to widen Perris Boulevard from Cactus Avenue south to city limits. The improvement project will widen Perris Boulevard to a six-lane street section, consistent with the General Plan. Construction is scheduled to start in the summer of 2012 and end in May 2013. The widening will encompass the improvements defined in the DEIR to improve operations of the roadway to the City's level of service standard and mitigate the proposed Project's contribution to the impact. With implementation of the City's improvements to Perris Boulevard and implementation of Mitigation Measures 4.5.6.1A

MV00169974

and 4.5.6.1B requiring that the Project applicant pay traffic impact fees, project-specific impacts will be reduced to less than significant levels. (DEIR, pgs. 4.4-18 to 4.4-19)

b. Year 2013 Cumulative With Project Conditions Intersection and Roadway Segments

Potential Significant Impact: The EIR evaluated and concluded that eleven intersections and four roadway segments are forecasted to exceed satisfactory levels of service in the year 2013 cumulative plus project conditions.

Finding: Implementation of the following mitigation measures will reduce the Project's contribution to cumulatively considerable intersection and roadway segment impacts to a less than significant level:

4.5.6.2A. *Prior to the issuance of occupancy permits, the project applicant shall have constructed the site access roadway improvements outlined below.*

Indian Street/South Project Driveway: Restripe to convert center turn lane on Indian Street to a two-way left-turn lane. This location does not meet a peak hour signal warrant. This is a site-adjacent improvement to be constructed by the project applicant.

Facts in Support of the Finding: According to Section 4.5 of the DEIR, an intersection and roadway segment level of service analysis was conducted for the year 2013 cumulative with project condition to determine the Project's contribution to cumulative traffic impacts to local intersections and roadway segments. As identified in Table 4.5.E in the DEIR, the addition of Project traffic to the year 2013 cumulative scenario would result in conditions exceeding the established LOS standard at the following intersections:

- I-215 Southbound Ramps/Harley Knox Boulevard (a.m. and p.m. peak hours);
- I-215 Northbound Ramps/Harley Knox Boulevard (a.m. and p.m. peak hours);
- Indian Street/South Project Driveway (p.m. peak hour);
- Indian Street/Harley Knox Boulevard (a.m. and p.m. peak hours);
- Perris Boulevard/Gentian Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Iris Avenue (a.m. and p.m. peak hours);

MV00169975

- Perris Boulevard/Krameria Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Nandina Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Grove View Road (a.m. and p.m. peak hours);
- Perris Boulevard/South Project Driveway (a.m. and p.m. peak hours); and
- Perris Boulevard/Harley Knox Boulevard (a.m. and p.m. peak hours).

The project contributes to the failure to meet the level of service standard at ten of the eleven intersections resulting in a significant cumulative impact. The unsatisfactory level of service at the Indian Street/South Project Driveway intersection is considered to be a project-specific impact because the need for the intersection is exclusively for project access.

As identified in Table 4.5.E in the DEIR, the addition of Project traffic to the year 2013 cumulative scenario would result in conditions exceeding the established LOS standard at the following roadway segments:

- Harley Knox Boulevard west of Indian Street (eastbound and westbound);
- Indian Street south of South Project Driveway (northbound and southbound);
- Perris Boulevard north of Grove View Road (southbound only); and
- Perris Boulevard south of South Project Driveway (northbound and southbound).

Section 4.5 of the DEIR identifies the improvements necessary to maintain the level of service standard at the intersections and roadways impacted in the year 2013 plus project condition. The roadway and intersection improvements are consistent with the City's General Plan and DIF program and are included in the County's TUMF program. A portion of the City's DIF is allocated toward funding improvements to the City's transportation system and the specific improvements are based on the General Plan Circulation Element.

The following improvements were identified in the DEIR to maintain or improve the operational level of service of the impacted intersections and roadways. The improvements required to maintain or to improve the level of service operations of transportation facilities affected by the project will be constructed through the City's DIF as supplemented by the County's TUMF program. The project will participate with these programs as part of **Mitigation Measures 4.5.6.1A and 4.5.6.1B**. The list of improvements is as follows:

MV00169976

- I-215 Southbound Ramps/Harley Knox Boulevard: Restripe the left-most westbound through lane as a left-turn lane. Restripe the off-ramp to provide two left-turn lanes and a shared through/right-turn lane. This improvement is part of the TUMF program.

- I-215 Northbound Ramps/Harley Knox Boulevard: Restripe the northbound shared through/left-turn lane as a shared left-turn/through/right-turn lane. Add an eastbound free right-turn lane. This improvement is part of the TUMF program.

- Indian Street/Harley Knox Boulevard: Add an eastbound through lane. Provide overlap phasing for the southbound right-turn lane. These improvements are consistent with the City of Perris General Plan Circulation Element. This improvement is part of the TUMF program.

- Perris Boulevard/Gentian Avenue: Add a southbound through lane. This improvement is consistent with the City of Moreno Valley's General Plan Circulation Element. Perris Boulevard/Iris Avenue: Add a second westbound left-turn lane and an eastbound right-turn lane. These improvements are consistent with the City of Moreno Valley's General Plan Circulation Element. This improvement is part of the City DIF and County TUMF programs.

- Perris Boulevard/Krameria Avenue: Add two southbound through lanes, a northbound through lane, and a northbound right-turn lane. These improvements are consistent with the City of Moreno Valley's General Plan Circulation Element. This improvement is part of the City DIF and County TUMF programs.

- Perris Boulevard/Nandina Avenue: Add a southbound through lane. This improvement is consistent with the City of Moreno Valley's General Plan Circulation Element. This improvement is part of the City DIF and County TUMF programs.

- Perris Boulevard/Grove View Road: Add a southbound through lane. This improvement is consistent with the City of Moreno Valley's General Plan Circulation Element. This improvement is part of the City DIF and County TUMF programs.

MV00169977

- Perris Boulevard/South This improvement is part of the City DIF and County TUMF programs.

- Project Driveway: Add a southbound through lane. This improvement is consistent with the City of Moreno Valley's General Plan Circulation Element. This improvement is part of City DIF and TUMF programs.

- Perris Boulevard/Harley Knox Boulevard: Add two southbound through lanes, one northbound through lane, a second eastbound left-turn lane, and overlap phasing for the southbound right-turn lane. These improvements are part of the TUMF program.

- Harley Knox Boulevard west of Indian Street: Widen to a six-lane Divided Arterial. This improvement is consistent with the City of Perris General Plan Circulation Element. This improvement is part of the TUMF program.

- Indian Street south of South Project Driveway: Widen to a four-lane Undivided Arterial. This improvement is consistent with the City of Moreno Valley General Plan Circulation Element. This improvement is part of the City of Moreno Valley DIF and TUMF programs.

- Perris Boulevard north of Grove View Road: Widen to a six-lane Divided Arterial. This improvement is consistent with the City of Moreno Valley General Plan Circulation Element. This improvement is part of the City's DIF and TUMF programs.

- Perris Boulevard south of South Project Driveway: Widen to a six-lane Divided Arterial. This improvement is consistent with the City of Moreno Valley and City of Perris General Plan Circulation Elements. This improvement is part of the City of Moreno Valley DIF and County TUMF programs.

With implementation of these improvements, all intersections and roadway segments would operate at the applicable performance standard or better during peak hours for year 2013 cumulative with project conditions resulting in a less than significant impact.

MV00169978

The project will contribute toward these future intersection and roadway improvements to maintain the applicable level of service standard through payment of frees required as part of the DIF and TUMF programs. As part of its Capital Improvement Program (CIP), the City determines the timing of necessary roadway improvements based on periodic review of citywide traffic counts, traffic trends, and a review of traffic accidents. The CIP projects are funded by a variety of sources including the County TUMF program and the City's DIF program and general fund. (DEIR, pgs. 4.4-19 to 4.4-28)

C. ENVIRONMENTAL IMPACTS NOT FULLY MITIGATED TO A LEVEL OF LESS-THAN-SIGNIFICANT

The Moreno Valley Planning Commission finds the following environmental impacts identified in the EIR remain significant even after application of all feasible mitigation measures: agricultural resources (individually and cumulative), air quality (individually and cumulative), cumulative climate change and greenhouse gas emissions, transportation (and cumulative). In accordance with CEQA Guidelines Section 15092(b)(2), the Planning Commission of the City of Moreno Valley cannot approve the Project unless it first finds (1) under *Public Resources Code* Section 21081(a)(3), and CEQA Guidelines Section 15091(a)(3), that specific economic, legal, social technological, or other considerations, including provisions of employment opportunities to highly trained workers, make infeasible the mitigation measures or Project alternatives identified in the EIR; and (2) under CEQA Guidelines section 15092(b), that the remaining significant effects are acceptable due to overriding concerns described in the CEQA Guidelines Section 15093 and, therefore, a statement of overriding considerations is included herein.

1. <u>Agricultural Resources (Individual and Cumulative Impacts)</u>

a. Conversion of State Designated Farmland

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project could impact 16.89 acres of Prime Farmland, 16.23 acres of Farmland of Local Importance, and 38.69 acres of Farmland of Local Importance.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant as there are no known feasible mitigation measures that could reduce this impact to a level

MV00169979

of less than significant. Accordingly, Project-related impacts to state designated farmland will remain significant and unavoidable.

Facts in Support of the Finding: Section 4.1 of the DEIR identifies several potential agricultural conservation measures contained in the City's General Plan that include: enrolling productive agricultural land into a Williamson Act Contract; providing protection to ongoing agricultural operations from complaints and nuisance complaints from adjacent new development; protecting productive agricultural land subject to conversion through the purchase of or transfer of its development rights; purchasing conservation easements on existing agricultural land to ensure that the land is never converted to urban uses; and donating funds to a regional or statewide program that promotes and implements the use of agricultural land conservation easements.

The potential agricultural conservation measures identified in the DEIR are not considered to be feasible by the City for the following reasons:

Williamson Act Contracts: Williamson Act contracts are entered into voluntarily by property owners and the City cannot force owners to participate in this program. In addition, Williamson Act contracts will result only in temporary preservation of agricultural land since property owners have the option of non-renewal of these contracts at any time after the ten-year contract period ends.

Protecting Existing Agricultural Operations: Providing protection for ongoing agricultural activities from new developments, such as buffers between agricultural operations and new development or requiring the notification and disclosure of agricultural activities to the purchasers adjacent properties, will not permanently protect agricultural land.

Transfer of Development Rights, Conservation Easements, or Agricultural Conservation Bank: The purchase or transfer of development rights, purchase of conservation easements, or donation of funds to assist in the conservation of agricultural land would need to be implemented to ensure the preservation of agricultural land. As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the "…orderly conversion of agricultural lands." For this reason, the City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City's Development Code for all zoning categories. The existing and

MV00169980

continued reduction in productive agricultural operations within the City is produced by several factors including; urbanization in the City and Inland Empire resulting in dramatically increasing land prices; high water and labor costs; environmental regulation (e.g., insects, odors, groundwater contamination, and solid waste removal); and competition from Kern County and the Central Valley with lower land costs and reduced regulations. (DEIR, pgs. 4.1-10 to 4.1-14)

The City has determined that these measures are economically infeasible and that they are contrary to the City's vision (as stated in its General Plan) for the Project site and alternative mitigation has not been identified.

b. Conversion of Farmland to a Non-Agricultural Use

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project would result in the development of industrial uses on land that has historically been utilized for sod production.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant as there are no known feasible mitigation measures that could reduce this impact to a level of less than significant. Accordingly, Project-related impacts from the conversion of farmland to a non-agricultural use will remain significant and unavoidable.

Facts in Support of the Finding: According to Section 4.1 of the DEIR, the Project site has historically been in agricultural production and was most recently used to grow sod, and the sod production ceased operations in in August 2005 and has not been in agricultural production since that time. The conversion of the Project site to a non-agricultural use is a result of various economic and demographic factors. Increased cost for water and a continuing demand for housing and other development in the City and region are the primary reasons for this agricultural land conversion. A LESA model was also used to evaluate the site. It was determined that the Project LESA score is 64.38, which is considered significant. The Project does not include design features that would prevent the existing agricultural operations in the area from continuing. The Project would convert land that was previously used for agriculture and the development of the proposed Project may contribute to the conversion of adjacent lands. However, the Project is a logical extension of development in the City and does not create leapfrog development or islands of agricultural land that would be difficult to farm. The City recognizes development pressures within the City, and that these pressures will increase as the City continues to build out. Additionally, while the Project would not directly cause the conversion of adjacent agricultural land to non-agricultural uses because in has lied fallow for seven years, it would contribute to development pressure within the City that could potentially lead to the conversion of

MV00169981

agricultural land off site. However, as stated in the previous discussion of these Findings regarding the conversion of state designated farmland, the City has determined the agricultural conservation measures identified by the City are economically infeasible and that they are contrary to the City's vision (as stated in its General Plan) for the Project site and alternative mitigation has not been identified. (DEIR, pgs. 4.1-10 to 4.1-15)

c. Cumulative Agricultural Resource Impacts

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project would have a significant cumulative impact on agricultural resources in Riverside County.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant as there are no known feasible mitigation measures that could reduce this impact to a level of less than significant. Accordingly, Project-related impacts to cumulative state designated farmland will remain significant and unavoidable.

Facts in Support of the Finding: According to Section 4.1 of the DEIR, the Project-related impacts to Farmland of Statewide Importance and the conversion of agricultural land to a non-agricultural use cannot be mitigated through a local or regional program to mitigate impacts to agricultural resources. As stated previously, the City does not maintain a General Plan or zoning designation for agricultural uses and there are no Project-level feasible mitigation measures that would help reduce cumulative impacts. During the last reporting period (2006–2008), 6,540 acres of Prime Farmland, 2,366 acres of Farmland of Statewide Importance, and 8,873 acres of Farmland of Local Importance were converted to other uses. The cumulative effect of development in the region will continue to result in the conversion of agricultural lands to non-agricultural uses. Because agricultural land, including Prime Farmland, Farmland of Statewide Importance, and Farmland of Local Importance is a finite resource, the conversion of approximately 71 acres to industrial uses, combined with planned and future development in the City and region, represents a significant cumulative impact to agricultural operations and resources. (DEIR, pg. 4.1-16) As stated in the previous discussion of these Findings regarding the conversion of state designated farmland and conversion of agricultural land to a non-agricultu8rla use, the City has determined the agricultural conservation measures identified by the City are economically infeasible and that they are contrary to the City's vision (as stated in its General Plan) for the Project site and alternative mitigation has not been identified

MV00169982

2. Air Quality (Project-Specific and Cumulative Impact)

a. Short-Term Construction Emissions

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project's construction source emissions would temporarily exceed SCAQMD regional and localized significance thresholds, thereby potentially violating an air quality standard or contributing to an existing or projected air quality.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant but will be reduced to the extent feasible through mitigation measures. The Commission finds that **Mitigation Measures 4.2.6.1A through 4.2.6.1T** are incorporated into the MMRP for the Project, and will be implemented as specified therein. However, the Commission finds that even with application of the following mitigation measures, construction emissions-related air quality impacts are considered significant and unavoidable.

4.2.6.1A *Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the proposed Project construction documents, which shall be reviewed by the City.*

4.2.6.1B *Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators. Contract specifications shall be included in the proposed Project construction documents, which shall be reviewed by the City.*

4.2.6.1C *Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed Project construction documents, which shall be reviewed by the City.*

4.2.6.1D *All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.*

MV00169983

4.2.6.1E *The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.*

4.2.6.1F *The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM_{10} and $PM_{2.5}$ fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.*

4.2.6.1G *Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive construction areas (previously graded areas inactive for ten days or more).*

4.2.6.1H *The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by not allowing construction equipment to be left idling for more than five minutes (per California law).*

4.2.6.1I *The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).*

4.2.6.1J *If available, the project applicant shall use "Low-Volatile Organic Compounds" paints, coatings, and solvents with a VOC content lower than required under Rule 1113 (not to exceed 150 grams/liter; 1.25 pounds/gallon). High Pressure Low Volume (HPLV) applications of paints, coatings, and solvents shall be consistent with South Coast Air Quality Management District Rule 1113. Alternatively, the project applicant shall use materials that do not require painting or are pre-painted.*

4.2.6.1K *Grading plans, construction specifications and bid documents shall also include the following notations:*

- *Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;*

MV00169984

- *Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;*
- *Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;*
- *The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;*
- *The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;*
- *High-pressure injectors shall be provided on diesel construction equipment where feasible;*
- *Engine size of construction equipment shall be limited to the minimum practical size;*
- *Substitute gasoline-powered for diesel powered construction equipment where feasible;*
- *Use electric construction equipment where feasible;*
- *Install catalytic converters on gasoline-powered equipment where feasible;*
- *Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement;*
- *Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;*
- *Lunch vendor services shall be permitted on site during construction to minimize the need for off-site vehicle trips;*
- *All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered; and*

MV00169985

- *Suspend use of all construction equipment operations during second stage smog alerts.*

4.2.6.1L *Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on-site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM_{10} (fugitive dust) generation or other construction-related air quality issues.*

4.2.6.1M *All project entrances shall be posted with signs which state:*

- *Truck drivers shall turn off engines when not in use;*
- *Diesel delivery trucks servicing the project shall not idle for more than three (3) minutes; and*
- *Telephone numbers of the building facilities manager and CARB, to report violations.*

4.2.6.1N *When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.*

4.2.6.1O *All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.*

4.2.6.1P *Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.*

4.2.6.1Q *Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.*

4.2.6.1R *All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.*

4.2.6.1S *Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of*

MV00169986

large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.

4.2.6.1T *Reroute construction trucks away from congested streets and sensitive receptor areas.*

These measures shall be enforced by the on-site facilities manager (or equivalent.

Facts in Support of the Finding: Even after compliance with applicable SCAQMD Rules and implementation of Mitigation Measures 4.2.6.1A through 4.2.6.1T, Project construction activities would temporarily exceed SCAQMD regional and localized emissions thresholds for oxides of nitrogen (NO_x) and particulate matter (PM_{10} and $PM_{2.5}$). (See DEIR Tables 4.2-I and 4.2-J) Project construction-related emissions in exceedance of SCAQMD's regional and localized significance thresholds are therefore determined to be significant and unavoidable air quality impacts notwithstanding mitigation. (DEIR, pgs. 4.2-19 through 4.2-25).

b. Long-Term Operational Emissions

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project could potentially exceed applicable daily thresholds for operational activities.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant but will be reduced to the extent feasible through mitigation measures. The Commission finds that Mitigation Measures 4.2.6.3A and 4.2.6.3B is incorporated into the MMRP for the Project, and will be implemented as specified therein. However, the Commission finds that even with application of these mitigation measures, long term construction emissions-related air quality impacts are considered significant and unavoidable.

4.2.6.3A *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of design features, including but not limited to the following list, may be used to fulfill*

MV00169987

this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:

- *Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.*
- *Increase in insulation such that heat transfer and thermal bridging is minimized.*
- *Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.*
- *Incorporate dual-paned or other energy efficient windows.*
- *Incorporate energy efficient space heating and cooling equipment.*
- *Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards, as deemed acceptable by the City. Use automatic devices to turn off lights when they are not needed.*
- *To the extent that they are compatible with landscaping guidelines established by the City, use shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings at the project site.*
- *Use paint and a surface color palette for the project emphasizing light and off-white colors which reflect heat away from the buildings.*
- *Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs.*
- *Reduce energy demand associated with potable water conveyance using the following:*
    - *Landscaping palette emphasizing drought-tolerant plants;*
    - *Use of water-efficient irrigation techniques; and,*
    - *U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.*
- *Provide secure, weather-protected, on-site bicycle storage/parking.*

MV00169988

- *Provide on-site showers (one for males and one for females). Lockers for employees shall be provided.*
- *Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.*
- *Provide preferential parking for carpools, vanpools or other alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools on the project site plan.*
- *Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations on the project building plans.*
- *Implement compressed workweek schedules.*
- *Achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers.*
- *Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers.*
- *Use of fleet vehicles conforming to 2010 air quality standards or better.*
- *Installation of catalytic converters on gasoline-powered equipment.*

MV00169989

- *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets;*
- *Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles;*
- *Provision of preferential parking for EV and CNG vehicles;*
- *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance;*
- *Use of electric (instead of diesel or gasoline-powered) yard trucks;*
- *Use of SmartWay 1.25 rated trucks.*
- *Provide a display case or kiosk displaying transportation information including the RTA bus schedule in a prominent area accessible to employees.*
- *Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.*

4.2.6.3B *The project shall be designed to facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that are dedicated to the collection and storage of recyclable materials including: paper, cardboard, glass, plastics, and metals. Locations of proposed recyclable materials collection areas are subject to review and approval by the City. Prior to Final Site Plan approval, locations of proposed recyclable materials collection areas shall be delineated on the project site plan.*

Facts in Support of the Finding: Even after compliance with applicable SCAQMD Rules and implementation of Mitigation Measures 4.2.6.3A and 4.2.6.3B, Project operational activities will exceed SCAQMD daily emissions thresholds for ROG, NO_x, CO, and PM_{10}. (DEIR Table 4.2.K) Project operational-related impacts that exceed long-term, operational emissions thresholds are therefore determined to be significant and unavoidable air quality impacts notwithstanding mitigation. (DEIR, pgs. 4.2-26 to 4.2.28)

MV00169990

c. Cumulative Air Quality Impacts

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project could potentially result in a cumulatively considerable net increase of criteria pollutants for which the project region is in non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors).

Finding: Based on the entire record before us, this Council finds that this impact is potentially significant as there are no known feasible mitigation measures that could reduce this impact to a level of less than significant. Accordingly, Project-related impacts cumulative air quality impacts will remain significant and unavoidable.

Facts in Support of the Finding: Included in Section 4.2 of the DEIR, Table 4.2.K indicates that the long-term operation of the Project would contribute to long-term regional air pollutants despite implementation of mitigation measures. The Basin is in nonattainment for NO_X, PM_{10}, $PM_{2.5}$, and ozone at the present time; therefore, the operation of the proposed Project would exacerbate nonattainment of air quality standards within the Basin and contribute to adverse cumulative air quality impacts. Implementation of the proposed Project would unavoidably contribute to significant long-term cumulative air quality impacts. (DEIR, pg. 4.2-29)

3. <u>Climate Change and Greenhouse Gas</u>

a. Cumulative Impacts of Climate Change and Greenhouse Gas

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project could have a cumulative impact related to climate change and greenhouse gas emissions.

Finding: Based on the entire record before us, this Commission finds that the Project's impacts related to climate change and greenhouse gas emissions is potentially significant but will be reduced to the extent feasible through mitigation measures. The Commission finds that **Mitigation Measures 4.3.6.1A and 4.3.6.1C** are incorporated into the MMRP for the Project, and will be implemented as specified therein. However, the Commission finds that even with application of these mitigation measures, long term construction emissions-related air quality impacts are considered significant and unavoidable.

Facts in Support of the Finding: According to Section 4.3 of the DEIR, the Project is consistent with the strategies to reduce California's emissions to the levels proposed in Executive Order S-3-05.

MV00169991

However, the proposed Project's GHG emission contribution would result in a cumulative impact regarding climate change and greenhouse gas emissions and the cumulative impacts of the proposed Project on climate change and greenhouse gas emissions are considered to be significant and unavoidable. (DEIR, pgs. 4.3-21 4.3-27)

4. Transportation

a. Existing Plus Project and Cumulative Plus Project Freeway Segments and Freeway Merge/Diverge Areas

Significant Unavoidable Impact: The EIR evaluated and concluded that the Project would contribute to two freeway merge/diverge areas failing to maintain the level of service standard in the existing plus project condition. The EIR evaluated and concluded that the Project would contribute to four freeway segments and merge diverge areas failing to maintain the level of service standard in the year 2013 plus project condition.

Finding: Based on the entire record before us, this Commission finds that this impact is potentially significant as there are no known feasible mitigation measures that could reduce this impact to a level of less than significant. Accordingly, Project-related impacts to freeway segments will remain significant and unavoidable.

Facts in Support of the Finding: As indicated in Section 4.5 of the DEIR, the following two freeway segments are projected to operate at unsatisfactory levels of service in the existing plus project analysis:

- Harley Knox Boulevard Off-Ramp (diverge area) at Southbound I-215 (a.m. peak hour); and
- Harley Knox Boulevard On-Ramp (merge area) at Southbound I-215 (a.m. peak hour).

The following four freeway segments and freeway merge/diverge areas are projected to operate at unsatisfactory levels of service in the cumulative year 2013 plus project analysis:

- Freeway segment north of Harley Knox Boulevard (a.m. peak hour);
- Harley Knox Boulevard Off-Ramp (diverge area) at Southbound I-215 (a.m. and p.m. peak hours);
- Harley Knox Boulevard On-Ramp (merge area) at Southbound I-215 (a.m. peak hour); and

MV00169992

- Freeway segment south of Harley Knox Boulevard (a.m. peak hour).

Improvements to affected freeway segments are outside the City's jurisdiction. Since the City has no control over when and how these improvements will be in place, impacts associated with these identified freeway segments would remain significant and unavoidable until such improvements are constructed. (DEIR, pgs. 4.5-18 4.5-28)

D. ADEQUACY OF THE RANGE OF PROJECT ALTERNATIVES

The EIR analyzed four alternatives to the Project as proposed, and evaluated these alternatives for their ability to meet the Project's objectives as described in Section II.B above. CEQA requires the evaluation of a "No Project Alternative" to assess a maximum net change in the environment as a result of implementation of the Project. The No Project Alternative, referred to as the No Project/Existing Zoning Alternative, makes a reasoned assessment as to the future development of the subject site should the Project under consideration not be developed yet the site would be developed in a similar manner to the proposed Project and consistent with existing zoning for the site. A Reduced Intensity Alternative, a Commercial Center (mixed retail/office) Alternative, and an Off-site Alternative were also selected for analysis. CEQA requires the evaluation of alternatives that can reduce the significance of identified impacts and "feasibly attain most of the basic objectives of the proposed Project." Thus, in order to develop a range of reasonable alternatives, the Project Objectives must be considered when this Commission is evaluating the alternatives.

1. Alternative 1 – No Project/Existing Zoning Alternative

Description: The No Project/Existing Zoning Alternative (hereinafter referenced as the "No Project" Alternative), considers the environmental conditions that would occur if the subject site were developed consistent with its existing Specific Plan 208 zoning designation, consisting of an underlying land use of Business Park/Industrial. To allow for quantified comparison of potential impacts, the No Project Alternative was assumed to result in the development of approximately 1,420,000 square feet of industrial warehouse uses on approximately 63 acres and approximately 180,000 square feet of commercial service uses on approximately 8 acres as would be allowed under the existing zoning and land use designations. The commercial service component of this alternative would be located along the frontage of Perris Boulevard while the industrial warehouse uses would occupy the remaining portion of the site. (DEIR, pg. 6-12)

MV00169993

Impacts: The No Build Alternative, as referenced in Section 6.0 of the DEIR, would result in similar impacts when compared to the proposed Project. Similar to the Project, the No Build Alternative would result in less than significant impacts in the following areas: Aesthetics; Williamson Act Contracts/Agricultural Zoning and Forestry Resources; Biological Resources; Cultural Resources; Geology and Soils; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use; Mineral Resources; Noise; Population and Housing; Public Services; Recreation and Parks; and Utilities and Service Systems. The Project's significant and unavoidable agricultural impacts, air quality impacts, climate change and GHG impacts, and transportation impacts would also occur in the same manner as the proposed project. However, under the No Build Alternative, potential air quality, climate change, and traffic/transportation impacts would be greater than the proposed project because of the higher trip generation potential of the commercial uses.

Objectives: Under the No Build Alternative, the subject site would develop in a similar manner as the proposed Project, and most of the Project Objectives would be achieved. However, the objectives specifically oriented towards warehouse and industrial uses would be met at a reduced level due to the commercial component included in this Alternative.

Finding: Under the No Build Alternative, the project site would be developed with approximately 1,420,000 square feet of industrial warehouse uses on approximately 63 acres and approximately 180,000 square feet of commercial service uses on approximately 8 acres. This Alternative would result in the same significant and unavoidable impacts associated with agricultural resources, air quality, climate change and greenhouse gases, and traffic that have been identified within the DEIR. However, potential air quality, climate change, and traffic/transportation impacts would be greater than the proposed project because of the higher trip generation potential of the commercial uses. Because the No Build Alternative results in an increase in potential significant and unavoidable impacts in comparison to the proposed Project, the Planning Commission hereby rejects the No Build Alternative.

2. <u>Alternative 2 – Reduced Intensity Alternative</u>

Description: The Reduced Intensity Alternative assumes the same general land use type as the Project, but at a development intensity scoped to reduce the extent of regional threshold exceedances for air pollution and greenhouse gas emissions that would otherwise result from the Project. In that the same type of development is proposed, most if not all the Project Objectives would be achieved to a certain extent but at a reduced level. Implementation of the Reduced Intensity Alternative would

MV00169994

yield approximately 1,212,100 square feet of development, a reduction of approximately 25 percent or approximately 434,033 square feet, when compared to the approximately 1,616,133 square-foot Project analyzed in the EIR.

Impacts: Under the Reduced Intensity Alternative, impacts related to agricultural resources would be similar to the proposed Project as the same amount of land would be disturbed. Similarly, impacts related to short-term construction-related air quality would be similar to the proposed Project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Because of the decrease in vehicle trips achieved under this alternative, impacts to the operation of local roadways and intersections would be proportionally reduced from what was identified for the proposed Project; however, long-term traffic impacts to state freeway segments and merge/diverge areas would remain significant and unavoidable. Long-term operational-related air quality impacts would be reduced in magnitude when compared to the Project but would remain significant and unavoidable. Impacts associated with the generation of greenhouse gas emissions would also be reduced proportionate to the reduction in building area in comparison to the proposed project, but would remain significant and unavoidable.

Objectives: The Reduced Intensity Alternative would, to some degree, realize the Project Objectives. However, because the scale of the development would be diminished under this Alternative, the resulting generation of sales tax, the number of jobs created, and potential second tier economic benefits to the City and region (e.g. wholesale/retail support sales; temporary and long-term construction jobs, and facilities maintenance employment opportunities) would likely be reduced when compared to the Project.

Finding: Under the Reduced Intensity Alternative, a light industrial warehouse/ distribution facility reduced by approximately 25 percent (or 434,033 square feet) would be realized as compared to the Project. The Planning Commission hereby finds that the Reduced Intensity Alternative will not avoid or substantially reduce the significant and unavoidable agricultural resources impacts, construction and operational air quality impacts, and cumulative greenhouse gas impacts identified in the EIR. This Alternative would not meet Project Objectives to the same extent as the Project. Furthermore, the scale of the reduction in intensity would not maximize or realize the economic potential of the site. Based on the reduced scope of development, the Reduced Intensity Alternative would diminish capacities and capabilities to satisfy existing and projected unmet market demands within the trade area. The Reduced Intensity Alternative would also result in comparatively fewer opportunities to provide jobs, as compared to the Project. Therefore, the Planning Commission rejects the Reduced

MV00169995

Intensity Alternative on the basis that it fails to avoid or substantially reduce the significant and unavoidable impacts of the Project and does not meet the Project Objectives as well as the Project. The Planning Commission also finds that each of these considerations constitutes a ground for rejecting this alternative that is independently sufficient to support the Planning Commission's rejection of this alternative.

3. Alternative 3—Commercial Center (Mixed Commercial/Office)

Description: As identified in Section 6.0 of the DEIR, the Commercial Center Alternative would result in the development of commercial service and office uses on the Project site. Although business and professional offices, financial institutions, and medical clinics are permitted in SP208, they are permitted only in the industrial support areas while commercial service-oriented uses are a permitted throughout the SP208 Industrial designation. For this reason, the General Plan and zoning designations for the site would need to be amended to accommodate the business and professional offices. Permitted commercial service uses include, but are not limited to, Automotive Sales/Rental/Leasing & Accessories, Automotive/Truck Repair, Business Supply/Equipment Sales/Rental & Services, and Repair Services. Approximately 760,000 square feet of commercial service uses would be developed on approximately 35 acres. The balance of the site (35 acres) would be developed with up to approximately 760,000 square feet of office uses.

Impacts: As identified in Section 6.0 of the DEIR, the Commercial Center Alternative would result in similar impacts for the following eight environmental issues: Agriculture and Forestry Resources; Biological Resources; Cultural Resources; Geology and Soils; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; and Mineral Resources. Because of the increase in vehicle trips under this alternative, impacts to the operation of local roadways and intersections would be proportionally greater than what was identified for the proposed Project. Long-term traffic impacts to state freeway mainline segments and merge/diverge areas would remain significant and unavoidable. Under the Commercial Center Alternative, impacts related to short-term construction emissions would be similar to the proposed Project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related air quality emissions would be increased in magnitude because of the increase in vehicle trips when compared to the Project and would remain significant and unavoidable. Traffic-related noise would be increased in magnitude but would be similarly mitigated like the proposed Project and would remain less than significant.

MV00169996

Objectives: Under this alternative, some of the proposed Project objectives are not met as warehouse uses would not be built. However, development of this alternative would provide new employment opportunities for residents of Moreno Valley, but not within the industrial employment sector.

Findings: Under the Commercial Center Alternative, development of commercial service and office uses would occur. This Alternative would have similar impacts that have been identified within the DEIR. However, the Commercial Center Alternative would result in an increase in trip generation in comparison to the proposed Project, and would result in an increase in the severity of the significant and unavoidable impacts to construction and operational air pollution emissions, climate change and greenhouse gas emission, and traffic. The Planning Commission finds that the Commercial Center Alternative would fulfill some but not all of the Project Objectives. Moreno Valley residents would have more opportunities for employment but a warehouse would not be built. Because the Commercial Center Alternative will not fulfill the primary objective of the Project and the severity of significant and unavoidable impacts would be increased in comparison to the proposed Project, the Commission hereby rejects the Commercial Center Alternative.

4. Alternative 4—Off-Site Location

Description: As identified in Section 6.0 of the DEIR, this alternative would result in the same intensity of development of approximately 1,616,133 square feet of warehouse uses on approximately 70.3 acres. The alternative Project site identified by the City is bounded by Kramaria Street (extended) to the north, vacant and partially developed property and March Air Reserve Base to the west, Indian Street to the east, and the Perris Valley Storm Drain and vacant land to the south. The off-site location is approximately 1.0 miles northwest of the Project site and is within the same Industrial Area Specific Plan as the proposed Project. This alternative off-site property is not owned or under the control of the applicant. The off-site location is currently zoned SP 208 I and is designated Business Park in the City's General Plan, identical to the proposed Project development of this site would not require soil import, inherently reducing impacts form air pollution emissions during construction.

Impacts: Section 6.0 of the DEIR, identifies nine environmental issues that would have similar impacts as the proposed Project. These issues are: Cultural Resources; Geology and Soils; Hydrology and Water Quality; Land Use and Planning; Mineral Resources; Population and Housing; Public Services; Recreation; and Utilities and Service Systems. With the Off-Site Location Alternative, impacts related to air quality and traffic impacts would be similar to those identified with the

MV00169997

proposed Project. Short-term construction and long-term air quality operational and climate change/greenhouse gas emissions impacts under this alternative would remain significant and unavoidable and would result in similar conditions as identified for the proposed Project. Additionally, due to adjacent sensitive receptors, potential impacts to these receptors would be greater in magnitude when compared to the proposed Project. Similarly, noise impacts would be greater in magnitude due to the adjacent sensitive receptors. Operational traffic would result in increased traffic on vanity roadways and may impact different intersection and roadways in comparison to the proposed Project. Under this Alternative, impacts to agricultural resources would be eliminated.

Objectives: The Off-Site Alternative would meet most of the Project objectives. The location of the Off-Site Alternative further north of Harley Knox Boulevard would not meet the Project objectives of locating distribution services near transportation corridors and clustering such uses near the state highway system.

Finding: Under the Off-Site Alternative, development of the warehouse would occur in a different location. This Alternative would have similar impacts that have been identified within the DEIR. And most of the objectives of the proposed Project would be met, would not meet the Project objectives of locating distribution services near transportation corridors and clustering such uses near the state highway system. The Commission finds that the Off-Site Alternative would have similar impacts to all environmental issues except for agriculture because this Alternative would eliminate the significant and unavoidable impacts to agricultural resources.. Because the Off-Site Alternative will not substantially reduce the environmental impact of the Project and it would not meet the Project objectives of locating distribution services near transportation corridors and clustering such uses near the state highway system, the Commission hereby rejects the Off-Site Alternative.

5. Alternatives Considered and Rejected

A variety of additional alternatives were considered as part of the DEIR's Alternatives Analysis. (DEIR, pgs. 6-3 through 6-5) Three possible alternatives were considered and rejected because they could not accomplish the basic objectives of the Project or they were considered infeasible. Per the *CEQA Guidelines* (Section 15126.6(c)), factors that may be considered when addressing the feasibility of alternatives include failure to meet most of the stated project objectives, infeasibility, or inability to avoid significant environmental effects. The purpose of the proposed Project is to provide for and expand employment and revenue opportunities within the City

MV00169998

of Moreno Valley. The proposed Project would expand employment options in a location that is convenient to existing transportation corridors, convenient to existing and future City residents and would augment the City's economic base. The following provides and discussion of the three development scenarios that were considered and rejected as potential alternatives to implementation of the proposed Project based on Section 15126.6 of the *CEQA Guidelines* because they did not feasibly attaining most of the basic objectives of the Project while reducing or avoiding any of the significant effects of the proposed Project:

- No Build Alternative: No development would take place within the Project limits and no impacts would occur. However, disallowing development of the site, as suggested by this alternative, would not fulfill the primary objectives of the proposed Project and the site would likely be developed in accordance with existing zoning should the Project not move forward. Retention of the project site in its current condition would not expand employment opportunities to residents of the City. Retaining the site in its current undeveloped condition would not generate the revenue (e.g., property tax) that could augment the City's current revenue stream. Therefore, the No Build Alternative was rejected from further consideration in the EIR.

- Residential Alternative: The Residential Alternative would develop the 71-acre project site with approximately 355 single-family units based on the City's R5 zone. The R5 zone was utilized as this is the zoning designation of the nearest residential uses to the north along Perris Boulevard and north of the Perris Valley Storm Drain channel. A zone change, General Plan Amendment, and Specific Plan Amendment would be required for this alternative to change the project site from its existing Business Park/Light Industrial (BP) General Plan designation and Industrial Area Plan (SP208 I) zoning designation to a residential R5 designation. Furthermore, a Specific Plan Amendment would be required to remove the project site from the underlying Industrial Specific Plan 208. Since the Residential Alternative consists only of residential uses, employment-generating opportunities would not occur aside from temporary construction work, which would be filled predominantly by those already residing in the area. The residential uses would produce demand for public services that would exceed the amount of municipal revenues it would generate. The project's full potential to utilize the area's close proximity to various freeways and transportation corridors would not be realized as only residential uses would occur under the Residential Alternative. Additionally, the development of the entire 71-acre project site under this alternative would

MV00169999

result in the placement of the residential uses within an area planned for industrial uses which could result in additional adverse impacts such as exposure to air pollutants, noise, and land use incompatibilities. This alternative has been rejected because it would result in greater impacts and would not satisfy the basic City employment generating objectives for development of the Project site.

- Mixed Commercial/Residential Alternative: The Mixed Commercial/Residential Alternative would develop the 71-acre project site with approximately 690,000 square feet of Community Commercial uses and 532 multiple-family units. A zone change, General Plan Amendment, and Specific Plan Amendment would be required for this alternative to change the project site from its existing Business Park/Light Industrial (BP) General Plan designation and SP208 I zoning designation to a residential designation and commercial designation. Additionally, a Specific Plan Amendment would be required to remove the project site from the underlying Industrial Specific Plan 208. While the commercial component of this Alternative would utilize the project site's close proximity to nearby transportation corridors, the development of the remainder of the site with residential uses would not provide the varied employment and service uses and revenue associated with the proposed project. The development of approximately half of the project site under this alternative with residential uses would result in the placement of the residential uses adjacent to SP208 I industrial/business park uses which could potentially result in additional adverse impacts such as exposure to air pollutants, noise, and land use incompatibilities. The residential component of this alternative would produce demand for public services that would exceed the amount of municipal revenues it would generate, and there would be little to no employment opportunities created. Therefore, the mixed commercial/residential alternative would not meet the project objectives of providing new employment and revenue generation options in close proximity to local consumers to the same degree as the proposed project. The employment opportunities and economic benefits derived from the proposed project are superior to the Mixed Commercial/Residential Alternative. This alternative has been rejected because it would result in greater impacts and would not satisfy the basic City employment generating objectives for development of the project site.

MV00170000

6. Environmentally Superior Alternative

As explained by Section 6.0 in the DEIR, Alternative 2 (Reduced Intensity Alternative) reduces the severity of Project related air quality impacts. However, long-term air quality impacts, would remain significant after mitigation for this alternative for ROG, NO_x, PM_{10} and $PM_{2.5}$. In a similar manner, Alternative 2 would reduce the volume of daily traffic trips when compared to the proposed Project; however, such impacts to state freeway mainline segments and merge/diverge areas would remain significant and unavoidable until freeway improvements are completed by the state. Alternative 2 would also reduce the quantity of greenhouse gas emission when compared to the proposed Project; however, impacts to Climate Change would remain significant and unavoidable. The remaining environmental issues would ultimately be similar to the proposed Project through adherence to existing standards and mitigation measures. Based on the analysis in Section 6.0 and the summary contained in Table 6.K, Alternative 2, the Reduced Intensity Alternative, is the environmentally superior alternative. The amount of development under this alternative would be reduced when compared to the proposed Project; however, the Alternative 2 would not satisfy several of the Project objectives because it would reduce the level at which it meets the employment generating Project objectives. Because the Reduced Intensity Alternative allows the development of warehouse uses and the provision of new employment opportunities, it meets many of the City's stated Project objectives, while at the same time reduces the impacts associated with the proposed Project. However, because of the lower industrial density, the Alternative fails to meet several key employment generating objectives related to density efficiencies in the same manner as the proposed Project.

E. GROWTH-INDUCING IMPACTS

CEQA requires a discussion of ways in which the proposed Project could be growth inducing. Specifically, CEQA Guidelines Section 1512602(d) states than an EIR must describe the ways in which the proposed Project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment.

Section 5.0 of the DEIR identifies the extent to which the new jobs created by a Project are filled by existing residents is a factor that tends to reduce the growth inducing effect of a project. Construction of the proposed Project will create short-term construction jobs. Due to the existing high unemployment levels that exist in the City, the potential exists for these short-term positions to be filled by workers who, for the most part, reside in the City or neighboring

MV00170001

communities to the Project area. Therefore, construction of the proposed Project will not generate a permanent increase in population within the Project area.

As previously identified, the proposed Project is expected to employ 646 people. These full-time positions are also anticipated to be filled by workers who, for the most part, reside in the Project area due to high unemployment levels that exist in the City. Operations of the proposed Project will not generate a permanent increase in population within the Project area.

The area surrounding the Project site is governed by the City of Moreno Valley General Plan and the area is guided by Specific Plan 208. Specific Plan 208 guides land use within the Project area to ensure that new development and redevelopment is implemented consistent with the land use policies, controls, and standards contained in Specific Plan 208. Any development of remaining undeveloped land adjacent to the Project site would require its own discretionary approvals and is not reliant on the proposed Project. However, development of the Project site may lead to indirect growth in the Specific Plan area by making available the extension of infrastructure such as water, sewer, drainage, etc. This growth has been planned for and is guided by Specific Plan 208.

The proposed Project would occur within an area currently designated for industrial uses. The proposed Project would not require a General Plan Amendment nor does it require a change in the underlying zoning designation. In addition, the Project reflects the City of Moreno Valley's vision for the area and is consistent with Specific Plan 208. Land uses surrounding the Project site would be in conformance with the City's General Plan and Specific Plan 208. Impacts to population and housing are less than significant; see Section 13 Population and Housing of the Initial Study (Appendix A of the DEIR).

The proposed Project would not eliminate a constraint for development of an approved Project within the City of Moreno Valley. There are no projects in the City of Moreno Valley or surrounding cities that have been approved but are conditioned or dependent on additional improvements at the Project site. Specific Plan 208 guides land uses surrounding the Project site to ensure compatibility between existing operations and adjacent surrounding development. Additionally, the proposed Project would not add capacity to urban services or infrastructure that would be utilized by other project proponents in the surrounding area.

The proposed Project would not result in any significant pressure to redevelop the area around the Project site at a higher density. As previously stated, the development of remaining

MV00170002

undeveloped land adjacent to the Project site is independent and not reliant on the proposed Project. Therefore, implementation of the proposed Project would not result in redevelopment of adjacent lands at a higher intensity than already prescribed in the City of Moreno Valley's General Plan and Specific Plan 208.

F. SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Public Resources Code Section 21100(b)(2)(B) and CEQA Guidelines Sections 15126(c), 15126.2(c), and 15127, require that for certain types or categories of projects, an EIR must address significant irreversible environmental changes that would occur should the project be implemented. As presented at CEQA Guidelines Section 15127, the topic of Significant Irreversible Environmental Changes needs to be addressed in EIRs prepared in connection with any of the following activities:

(a) The adoption, amendment, or enactment of a plan, policy, or ordinance of a public agency;

(b) The adoption by a local agency formation commission of a resolution making determinations; or

(c) A project which will be subject to the requirements for preparing of an environmental impact statement pursuant to the requirements of the National Environmental Policy Act of 1969, 42 U.S.C. Sections 4321-4347.

The Project does not trigger any of the conditions cited in Guidelines §15127. Nonetheless, this EIR analysis addresses any significant irreversible environmental changes which would be involved in the proposed action should it be implemented [Guidelines, Sections 15126(e) and 15127]. An impact would fall into this category if:

- The project would involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of the project would generally commit future generations of people to similar uses;
- The project involves uses in which irreversible damage could result from any potential environmental incidents associated with the project; and/or

MV00170003

- The proposed consumption of resources is not justified (e.g., the project could waste energy).

Determining whether the proposed project may result in significant irreversible effects requires a determination of whether key resources would be degraded or destroyed in such a way that there would be little possibility of restoring them. The project site is generally fallow agricultural land with the site historically used for sod farming operations. However, as identified within the City's General Plan, the City anticipates the eventual conversion of agricultural uses to urban uses and the proposed project would permanently alter the site by converting predominantly agricultural uses to urban uses. This is a significant irreversible environmental change that would occur as a result of project implementation. Because no significant mineral resources were identified within the project limits, no significant impacts related to these issues would result from development of the project site. Natural resources in the form of construction materials would be utilized in the construction of the proposed project and energy resources in the form of electricity and natural gas would be used during the long-term operation of the project; however, their use is justified in supporting the City's planned use of the site and is not expected to negatively impact the availability of these resources.

In addition, this industrial warehouse project, in concert with the other built or approved industrial warehouse projects, will fundamentally change the character and land use pattern of this portion of the City. Many of the project-specific impacts are addressed, as outlined above, but the change in the use of the land from agricultural to industrial represents a substantial irreversible change for this area. However, this is an intended change a verified by the City's General Plan land use designations and zoning for the area. (DEIR pgs. 5-2 and 5-3)

VI. STATEMENT OF OVERRIDING CONSIDERATIONS

The Moreno Valley Planning Commission adopts this Statement of Overriding Considerations with respect to the significant unavoidable impacts associated with adoption of the Project as addressed in the EIR, specifically:

1. Agricultural Impacts—Conversion of State Designated Farmland;

2. Agricultural Impacts—Conversion to a Non-Agricultural Use; and

MV00170004

3. Cumulative Agricultural Impacts

4. Air Quality Impact—Construction Air Pollutant Emissions;

5. Air Quality Impact—Operational Air Pollutant Emissions; and

6. Cumulative Air Pollutant Emissions.

7. Climate Change and GHG Emissions —

8. Transportation—Existing and Cumulative Impacts to State Freeway Segments and Freeway Merge/Diverge Areas

The Moreno Valley Planning Commission hereby declares that, pursuant to CEQA Guidelines Section 15093, the Planning Commission has balanced the benefits of the proposed Project against any significant and unavoidable environmental impacts in determining whether to approve the proposed Project. If the benefits of the proposed Project outweigh the unavoidable adverse environmental impacts, those impacts are considered "acceptable."

The Planning Commission hereby declares that the EIR has identified and discussed significant effects that may occur as a result of the Project. With the implementation of the mitigation measures discussed in the EIR, these impacts can be mitigated to a level of less than significant except for the unavoidable and significant impacts discussed in Section V(C) herein.

The Planning Commission hereby declares that it has made a reasonable and good faith effort to eliminate or substantially mitigate the potential impacts resulting from the Project.

The Planning Commission hereby declares that to the extent any mitigation measures recommended to the City are not incorporated, such mitigation measures are infeasible because they would impose restrictions on the Project that would prohibit the realization of specific economic, social, and other benefits that this Planning Commission finds outweigh the unmitigated impacts.

The Planning Commission further finds that except for the Project, all other alternatives set forth in the EIR are infeasible because they would prohibit the realization of the Project objectives and/or specific economic, social or other benefits that this Planning Commission finds outweigh any environmental benefits of the alternatives or the other alternatives do not substantively reduce the severity of unavoidable and significant impacts.

MV00170005

The Planning Commission hereby declares that, having reduced the adverse significant environmental effects of the Project, to the extent feasible by adopting the proposed mitigation measures, having considered the entire administrative record on the Project and having weighed the benefits of the Project against its unavoidable significant impact after mitigation, the Planning Commission has determined that the social, economic and environmental benefits of the Project outweigh the potential unavoidable significant impacts and render those potential significant impacts acceptable based on the following considerations:

- The Project will provide development consistent with the General Plan and in conformance with SP 208, municipal standards, codes and policies;
- The Project provides development that improves and maximizes economic viability of a vacant site by transitioning the Project site into a productive light industrial use;
- The Project creates additional employment-generating opportunities for the City of Moreno Valley and surrounding communities; and
- The Project provides adequate infrastructure and public amenities, including upgrading and widened streets, signal upgrades and utility improvements.

As the CEQA Lead Agency for the proposed action, the City of Moreno Valley has reviewed the Project description and the alternatives presented in the EIR, and fully understands the Project and Project alternatives proposed for development. Further, this Commission finds that all potential adverse environmental impacts and all feasible mitigation measures to reduce the impacts from the Project have been identified in the Draft EIR, the Final EIR and public testimony. This Commission also finds that a reasonable range of alternatives was considered in the EIR and this document, Section V(E) above, and finds that approval of the Project is appropriate.

This Commission has identified economic and social benefits and important policy objectives, Section V above, which result from implementing the Project. The Commission has balanced these substantial social and economic benefits against the unavoidable significant adverse effects of the Project. Given the substantial social and economic benefits that will accrue from the Project, this Commission finds that the benefits identified herein override the unavoidable environmental effects.

MV00170006

California Public Resource Code 21002 provides: "In the event specific economic, social and other conditions make infeasible such Project alternatives or such mitigation measures, individual projects can be approved in spite of one or more significant effects thereof." Section 21002.1(c) provides: "In the event that economic, social, or other conditions make it infeasible to mitigate one or more significant effects of a project on the environment, the project may nonetheless be approved or carried out at the discretion of a public agency…" Finally, California Administrative Code, Title 4, 15093 (a) states: "If the benefits of a proposed Project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered „acceptable."""

The Planning Commission hereby declares that the foregoing benefits provided to the public through approval and implementation of the Project outweighs the identified significant adverse environmental impacts of the Project that cannot be mitigated. The Planning Commission finds that each of the Project benefits outweighs the unavoidable adverse environmental impacts identified in the EIR and, therefore, finds those impacts to be acceptable.

VII. CERTIFICATION OF THE FINAL ENVIRONMENTAL IMPACT REPORT

The Moreno Valley Planning Commission finds that it has reviewed and considered the FEIR in evaluating the Project, that the FEIR is an accurate and objective statement that fully complies with CEQA and the CEQA Guidelines, and that the FEIR reflects the independent judgment of the Planning Commission.

The Planning Commission declares that no new significant information as defined by CEQA Guidelines Section 15088.5 has been received by the Planning Commission after the circulation of the DEIR that would require recirculation. All of the information added to the FEIR merely clarifies, amplifies or makes insignificant modifications to an already adequate DEIR pursuant to CEQA Guidelines Section 15088.5(b).

The Planning Commission hereby certifies the EIR based on the following findings and conclusions:

MV00170007

A. Findings

1. CEQA Compliance

As the decision-making body for the Project, the Planning Commission has reviewed and considered the information contained in the Findings and supporting documentation. The Planning Commission determines that the Findings contain a complete and accurate reporting of the environmental impacts and mitigation measures associated with the Project, as well as complete and accurate reporting of the unavoidable impacts and benefits of the Proposed Project as detailed in the Statement of Overriding Considerations. The Planning Commission finds that the EIR was prepared in compliance with CEQA and that the Planning Commission complied with CEQA"s procedural and substantive requirements.

2. Significant Unavoidable Impacts/Statement of Overriding Considerations

The Project will have significant adverse impacts even following adoption of all feasible mitigation measures which are required by the Planning Commission. The following significant environmental impacts have been identified in the FEIR and will require mitigation but cannot be mitigated to a level of insignificance as set forth in Section V(C) of these Findings: Agricultural Impacts—Conversion of State Designated Farmland; Agricultural Impacts—Conversion to a Non-Agricultural Use; Cumulative Agricultural Impacts; Air Quality Impact—Construction Air Pollutant Emissions; Air Quality Impact—Operational Air Pollutant Emissions; Cumulative Air Pollutant Emissions; Climate Change and GHG Emissions; Transportation—Existing Year (2007) with Project Level of Service; and Transportation—Existing and Cumulative Impacts to State Freeway Segments and Freeway Merge/Diverge Areas.

The Planning Commission has eliminated or substantially reduced environmental impacts where feasible as described in the Findings, and the Planning Commission determines that the remaining unavoidable significant adverse impacts are acceptable due to the reasons set forth in the preceding Statement of Overriding Considerations.

3. Conclusions

a. All potentially significant environmental impacts from implementation of the proposed Project have been identified in the

MV00170008

EIR and, with the implementation of the mitigation measures defined herein and set forth in the MMRP, will be mitigated to a less-than-significant level, except for the impacts identified in Section V(C) above.

b. Other reasonable alternatives to the proposed Project that could feasibly achieve the basic objectives of the proposed Project have been considered and rejected in favor of the proposed Project.

c. Environmental, economic, social and other considerations and benefits derived from the development of the proposed Project override and make infeasible any alternatives to the proposed Project or further mitigation measures beyond those incorporated into the proposed Project.

VII. ADOPTION OF MITIGATION MONITORING AND REPORTING PROGRAM

Pursuant to *Public Resources Code* Section 21081.6, the Planning Commission hereby adopts, as conditions of approval of the Project, the Mitigation Monitoring and Reporting Plan (MMRP) set forth in Section 4.0 of the Final EIR. In the event of any inconsistencies between the mitigation measures as set forth herein and the MMRP, the MMRP shall control, except to the extent that a mitigation measure contained herein is inadvertently omitted from the MMRP, in which case such mitigation measure shall be deemed as if it were included in the MMRP.

MV00170009

4. MITIGATION MONITORING AND REPORTING PROGRAM

4.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program has been prepared for use in implementing mitigation for the:

VIP Moreno Valley Project

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2011081084) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the Initial Study and the Final EIR.

4.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate.

EXHIBIT B

4.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: VIP Moreno Valley Project **Applicant: Vogel Engineers, Inc.**

Date: June 2012

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
AIR QUALITY						
4.2.6.1A Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading and during grading operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.1B Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.1C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents,	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
which shall be reviewed by the City.						
4.2.6.1D All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During grading	Review of construction documents and on-site inspection		Issuance of a Stop Work Order
4.2.6.1E The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1F The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM10 and PM2.5 fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1G Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive construction areas (previously graded areas inactive for ten days or more).	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1H The contractor shall minimize	City of Moreno	Throughout	During	On-site inspection		Issuance of a

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by not allowing construction equipment to be left idling for more than five minutes (per California law).	Valley Engineering and Building and Safety	construction	Construction			Stop Work Order
4.2.6.1I The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1J If available, the project applicant shall use "Low-Volatile Organic Compounds" paints, coatings, and solvents with a VOC content lower than required under Rule 1113 (not to exceed 150 grams/liter; 1.25 pounds/gallon). High Pressure Low Volume (HPLV) applications of paints, coatings, and solvents shall be consistent with South Coast Air Quality Management District Rule 1113. Alternatively, the project applicant shall use materials that do not require painting or are pre-painted.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1K Grading plans, construction specifications and bid documents shall also include the following notations: • Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading and during grading operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order

MV00170013

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
for equipment where use of such fuels would void the equipment warranty; • Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads; • Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect; • The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site; • The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours; • High pressure injectors shall be provided on diesel construction equipment where feasible; • Engine size of construction equipment shall be limited to the minimum practical size; • Substitute gasoline-powered for diesel-powered construction equipment where feasible; • Use electric construction equipment						

MV00170014

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
where feasible; • Install catalytic converters on gasoline-powered equipment where feasible; • Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement; • Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs; • Lunch vendor services shall be permitted onsite during construction to minimize the need for offsite vehicle trips; • All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered. • Suspend use of all construction equipment operations during second stage smog alerts.						
4.2.6.1L Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on-site. In coordination and	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

MV00170015

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM10 (fugitive dust) generation or other construction-related air quality issues.						
4.2.6.1M All project entrances shall be posted with signs which state: • Truck drivers shall turn off engines when not in use; • Diesel delivery trucks servicing the project shall not idle for more than three (3) minutes; and • Telephone numbers of the building facilities manager and CARB, to report violations.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1N When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1O All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1P Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

MV00170016

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
4.2.6.1Q. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1R All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1S Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.	City of Moreno Valley Engineering and Building and Safety and Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.1T Reroute construction trucks away from congested streets and sensitive receptor areas.	City of Moreno Valley Engineering and Building and Safety and Planning Division	Prior to Grading and during grading and construction operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.3A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy	City of Moreno Valley Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits	Review of building plans and on-site inspection		Withhold Building Permits

MV00170017

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: • Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City. • Increase in insulation such that heat transfer and thermal bridging is minimized. • Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards, as deemed acceptable by the City. Use automatic devices to turn off lights when they are not needed. • To the extent that they are compatible with landscaping guidelines established by the City,						

MV00170018

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
use shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings at the project site. • Use paints and a surface color palette for the project emphasizing light and off-white colors which reflect heat away from the buildings. • Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs. • Reduce energy demand associated with potable water conveyance using the following: ○ Landscaping palette emphasizing drought-tolerant plants; ○ Use of water-efficient irrigation techniques; and, ○ U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads. • Provide on-site bicycle storage/parking consistent with City of Moreno Valley requirements. • Provide on-site showers (one for males and one for females). Provide lockers for employees.						

MV00170019

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information. • Provide preferential parking for carpools, vanpools or other alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools on the project site plan. • Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations on the project building plans. • Implement compressed workweek schedules; • Achieve at least 20% per year (as a percentage of previous percentage,						

MV00170020

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. • Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers. • Use of fleet vehicles conforming to 2010 air quality standards or better. • Installation of catalytic converters on gasoline-powered equipment. • Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets; • Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles; • Provision of preferential parking for EV and CNG vehicles; • Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance; • Use of electric (instead of diesel or gasoline-powered) yard trucks; • Use of SmartWay 1.25 rated trucks. • Provide a display case or kiosk						

MV00170021

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
displaying transportation information including the RTA bus schedule in a prominent area accessible to employees. • Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.						
4.2.6.3B The project shall be designed to facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that are dedicated to the collection and storage of recyclable materials including: paper, cardboard, glass, plastics, and metals. Locations of proposed recyclable materials collection areas are subject to review and approval by the City. Prior to Final Site Plan approval, locations of proposed recyclable materials collection areas shall be delineated on the project site plan. BIOLOGICAL RESOURCES						
Mitigation Measure BIO-1: No more than 72 hours prior to initiation of ground-	City of Moreno Valley Planning	Prior to Grading	Prior to Issuance of Grading Permit	Submittal of Evidence that the		Withhold Grading Permit

MV00170022

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
disturbing activities, a pre-construction survey shall be completed by a qualified biologist. The survey will identify special status avian species (if any) within the area of intended disturbance. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, **Mitigation Measure BIO-3** shall apply.	Division			pre-construction survey has been completed.		
Mitigation Measure BIO-2: No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction burrowing owl survey shall be completed by a qualified biologist for the planned disturbance area. The pre-construction burrowing owl surveys may be conducted as part of the survey required in **Mitigation Measure BIO-1**. A report detailing the findings of the pre-construction survey shall be submitted to the City prior to the initiation of ground-disturbing activities. In the event no burrowing owls are identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, **Mitigation Measures BIO-3** and **BIO-4** shall apply.	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit	Submittal of Evidence that a qualified biologist has been hired and the pre-construction survey has been completed. Submittal of a report of the survey findings.		Withhold Grading Permit
Mitigation Measures BIO-3. If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit			Withhold Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.						
Mitigation Measure BIO-4: If active burrowing owl burrows are detected outside the breeding season, then passive and/or active relocation may be approved following consultation with the CDFG and/or USFWS. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure that animals do not re-enter the holes/dens.	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit	Provide evidence to the City that the passive relocation plan has been approved by CDFG and USFWS.		Withhold Grading Permit
CULTURAL RESOURCES						
Mitigation Measure CUL-1: Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued. In the event fossiliferous deposits are encountered, the following measures shall be implemented:	City of Moreno Valley Planning Division	Prior to grading and on-going during ground disturbing activities.	Prior to Issuance of Grading Permit	Provide evidence to the City that a qualified paleontologist has been retained, and that the paleontologist(s) will be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. A report of findings		Withhold Grading Permit/ Issuance of a Stop Work Order

MV00170024

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources. • Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored. • Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.				shall be submitted to the City after the finalization of construction.		

MV00170025

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities. • Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources						
GEOLOGY AND SOILS						
Mitigation Measure GEO-1: Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered,	City of Moreno Valley Planning Division Engineering	Prior to grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit

MV00170026

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure. The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site. The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed. The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be						

MV00170027

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm. It should be noted that the above measure may be modified by the Final Geotechnical or Soils Report.						
Mitigation Measure GEO-2: Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans. MV00170029

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
Valley that the following measures have been be incorporated into the design and construction of the project: • Encourage use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project. • Encourage use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project. • Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions. • Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment where feasible. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants. • Design the project building to exceed the California Building Code's (CBC) 2008 Title 24 energy standard by 20%, including, but not limited to, any combination of the following: ○ Increase insulation such that heat transfer and thermal	Planning Division			plans and on-site inspection		

MV00170030

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
bridging is minimized. ○ Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. ○ Incorporate ENERGY STAR or better rated windows in the office area, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment. • Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. The landscaping plan shall be prepared by a registered landscape architect who will consider the following: ○ Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements. ○ Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading. • Install efficient lighting and lighting control systems. Use daylight as an						

MV00170031

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
integral part of the lighting systems in buildings. • Install light-colored "cool" roof and cool pavements. • Install energy-efficient heating and cooling systems, appliances and equipment, and control systems. • Install solar or light-emitting diodes (LEDs) for outdoor lighting. • Install electrical outlets on the exterior walls of the warehouse/office building (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.						
4.3.6.1C Prior to the issuance of occupancy permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the operation of the project: • The project applicant shall use low Global Warming refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO_2]) for refrigeration and fire suppression equipment. • Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows in the office areas.	City of Moreno Valley Building and Safety Planning Division	Prior to building permit and occupancy	Prior to issuance of occupancy permit	Review of construction documents and on-site inspection		Withhold Occupancy Permit

MV00170032

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Devise a comprehensive water conservation strategy appropriate for the project and its location. The strategy may include the following, plus other innovative measures that may be appropriate: • Install drought tolerant plants for landscaping. • Use reclaimed water for landscape irrigation within the project. Install the infrastructure to deliver and use reclaimed water. • Install water-efficient irrigations systems, such as weather-based and soil-moisture-based irrigation controllers and sensors for landscaping according to the California Department of Water Resources Model Efficient Landscape Ordinance. • Provide employee education about reducing waste and available recycling services.						
HYDROLOGY AND WATER QUALITY						
Mitigation Measure HYD-01: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall provide evidence to the City that a Notice of Intent (NOI) with the Regional Water Quality Control Board has been filed to be covered under the State NPDES General Construction Permit for discharge of stormwater associated with	City of Moreno Engineering	Prior to grading	Prior to the Issuance of Grading Permits	Submittal of copy of Notice of Intent to City filed with the RWQCB		Withhold Grading Permits

MV00170033

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
construction activities.						
Mitigation Measure HYD-02: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall submit to the State Water Quality Control Board, a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. Additionally, the SWPPP shall identify structural and nonstructural BMPs to control sediment and non-visible discharges from the site. BMPs to be implemented in the SWPPP may include but shall not be limited to the following: Sediment discharges from the site may be controlled by the following: gravel bags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs will be periodically inspected during construction, and repairs will be made when necessary as required by the SWPPP. Materials that have the potential to contribute non-visible pollutants to stormwater must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas.	City of Moreno Engineering	Prior to grading	Prior to the Issuance of Grading Permits	Review and approval of SWPPP		Withhold Grading Permits

MV00170034

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate any discharge from the site. Stockpiles will be surrounded by silt fences. The SWPPP will include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance. Additional BMPs and erosion control measures will be documented in the SWPPP and utilized if necessary. The SWPPP will be kept on site for the entire duration of project construction and will also be available to the local RWQCB for inspection at any time. In the event that it is not feasible to implement the above BMPs, the City of Moreno Valley can make a determination that other BMPs will provide equivalent or superior treatment either on or off site.						
Mitigation Measure HYD-03: Prior to the issuance of grading permits, the project proponent shall provide evidence to the City that the following provisions have been added to construction contracts for the project: • The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the SWPPP. Weekly inspections shall be performed on	City of Moreno Engineering	During grading and construction	Prior to Grading	Review of construction documents and on-site inspection		Withhold Grading Permit

sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and submitted to the City for inspection. In addition, the Contractor will also be required to maintain an inspection log and have the log on site to be reviewed by the City of Moreno Valley and the representatives of the Regional Water Quality Control Board.						
Mitigation Measure HYD-04: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley for a Final Water Quality Management Plan (F-WQMP). The F-WQMP shall specifically identify pollutants of concern, site design, source control, and treatment control BMPs that shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.	City of Moreno Engineering	Prior to grading	Prior to Issuance of Grading Permit	Submittal of WQMP to City for review and approval		Withhold Grading Permit
Mitigation Measure HYD-05: Prior to grading plan approval and the issuance of a grading permit, the project proponent shall submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for	City of Moreno Engineering	Prior to grading	Prior to Issuance of Grading Permits	Submittal of evidence that all requirements are fulfilled		Withhold Grading Permit

RESOLUTION NO. 2012-17

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF MORENO VALLEY APPROVING APPLICATION NO'S. PA09-0004 (PLOT PLAN FOR A 1,616,133 SQUARE FOOT WAREHOUSE), AND PA09-0012 (TENTATIVE PARECEL MAP NO. 36162).

Section 1:

WHEREAS, Vogel Engineers, Inc., has filed an application for the approval of PA09-0004, a plot plan for a 1,616,133 square foot warehouse distribution facility on 80 acres, as described in the title of this Resolution.

WHEREAS, on July 12, 2012, the Planning Commission of the City of Moreno Valley held a meeting to consider the application.

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

WHEREAS, there is hereby imposed on the subject development project certain fees, dedications, reservations and other exactions pursuant to state law and City ordinances;

WHEREAS, pursuant to Government Code Section 66020(d)(1), **NOTICE IS HEREBY GIVEN** that this project is subject to certain fees, dedications, reservations and other exactions as provided herein.

NOW, THEREFORE, BE IT RESOLVED, it is hereby found, determined and resolved by the Planning Commission of the City of Moreno Valley as follows:

A. This Planning Commission hereby specifically finds that all of the facts set forth above in this Resolution are true and correct.

B. Based upon substantial evidence presented to this Planning Commission during the above-referenced meeting on July 12, 2012, including written and oral staff reports, and the record from the public hearing, this Planning Commission hereby specifically finds as follows:

1. **Conformance with General Plan Policies –** The proposed use is consistent with the General Plan, and its goals, objectives, policies and programs.

ATTACHMENT 3

MV00170041

FACT: The General Plan encourages a mix of industrial uses to provide a diversified economic base and ample employment opportunities. Stated policies require the avoidance of adverse impacts on surrounding properties and the screening of industrial uses to reduce glare, noise, dust, vibrations and unsightly views. The project as designed and conditioned would achieve the objectives of the City of Moreno Valley's General Plan. The proposed project is consistent with the General Plan and do not conflict with the goals, objectives, policies, and programs established within the Plan.

2. **Conformance with Zoning Regulations** – The proposed use complies with all applicable zoning and other regulations.

   FACT: The project site is currently zoned Industrial. The proposed use will comply with all applicable zoning regulations and the requirements of the Moreno Valley Industrial Area Plan (SP #208). The project is designed in accordance with the provisions of Chapter 9.05 Industrial Districts of the City's Municipal Code.

3. **Health, Safety and Welfare** – The proposed use will not be detrimental to the public health, safety or welfare or materially injurious to properties or improvements in the vicinity.

   FACT: The proposed 1,616,133 square warehouse facility as designed and conditioned will not adversely affect the public health, safety or general welfare. A Final EIR has been prepared to address the potential environmental impacts of the project in accordance with the provisions of the California Environmental Quality Act (CEQA).

4. **Location, Design and Operation** – The location, design and operation of the proposed project will be compatible with existing and planned land uses in the vicinity.

   FACT: The project is located in the Moreno Valley Industrial Area Plan (SP 208), south side of Grove View Road between Perris Boulevard and Indian Street at the City's southern boundary.

   Land uses to the north include a Waste Management facility and a 426,700 square foot warehouse building. Land uses to the west include the 360,440 square foot i-Herb warehouse building, approximately 20 acres of vacant Industrial zoned land and a site currently used for container storage. Further to the west is the southern approach to the runways at March Air Reserve Base. Land uses to the east include a ministorage facility, the

MV00170042

approximately 255,000 square foot Masonite Door factory, and the approximate 1.2 million square foot Ross Dress For Less distribution facility.

The project site is located at the southerly City limits with a mixture of vacant Industrial zoned land and developed distribution land uses within the City of Perris on the south side of the Perris Valley Storm Drain.

The proposed warehouse distribution facility is a permitted use in the project site's Industrial zone. As designed and conditioned the project is compatible with existing and proposed land uses in the vicinity.

Section 2:

WHEREAS, the applicant, Vogel Engineers, Inc., has filed an application for the approval of PA09-0012 or Tentative Parcel Map No. 36162 to combine the existing four parcels located within the project site into a single 80 acre.

WHEREAS, on July 12, 2012, the Planning Commission of the City of Moreno Valley held a public hearing to consider the subject applications and the environmental documentation prepared for the project.

WHEREAS, all legal prerequisites to the adoption of this Resolution have occurred.

WHEREAS, there is hereby imposed on the subject development project certain fees, dedications, reservations and other exactions pursuant to state law and City ordinances;

WHEREAS, pursuant to Government Code Section 66020(d)(1), **NOTICE IS HEREBY GIVEN** that this project is subject to certain fees, dedications, reservations and other exactions as provided herein.

NOW, THEREFORE, BE IT RESOLVED, it is hereby found, determined and resolved by the Planning Commission of the City of Moreno Valley as follows:

A. This Planning Commission hereby specifically finds that all of the facts set forth above in this Resolution are true and correct.

B. Based upon substantial evidence presented to this Planning Commission during the above-referenced meeting on July 12, 2012, including written and oral staff reports, and the record from the public hearing, this Planning Commission hereby specifically finds as follows:

MV00170043

1. **Conformance with General and Specific Plans –** That the proposed land division is consistent with applicable general and specific plans.

   FACT: The proposed tentative parcel map is consistent with the General Plan designation of Business Park for the project site. The proposed parcel map will combine the existing four parcels located within the project site into a single 80 acre parcel. The proposed land division is consistent with existing goals, objectives, policies and programs of the general plan.

2. **Design Conformance with General and Specific Plans –** That the design or improvement of the proposed land division is consistent with applicable general and specific plans.

   FACT: The tentative parcel map as designed and conditioned will provide improvements that are consistent with the requirements of the project site's General Plan land use designation of Business Park.

3. **Physically Suitable for Proposed Development –** That the site of the proposed land division is physically suitable for the type of development.

   FACT: The project site is comprised of multiple vacant rectangular shaped parcels that are mostly flat. The project is located in the Moreno Valley Industrial Area Plan (SP 208), south side of Grove View Road between Perris Boulevard and Indian Street at the City's southern boundary. Land uses to the north include a Waste Management facility and a 426,700 square foot warehouse building. Land uses to the west include the 360,440 square foot i-Herb warehouse building, approximately 20 acres of vacant Industrial zoned land and a site currently used for container storage. Further to the west is the southern approach to the runways at March Air Reserve Base. Land uses to the east include a ministorage facility, the approximately 255,000 square foot Masonite Door factory, and the approximate 1.2 million square foot Ross Dress For Less distribution facility.

   The project site is located at the southerly City limits with a mixture of vacant Industrial zoned land and developed distribution land uses within the City of Perris on the south side of the Perris Valley Storm Drain.

   Overall, the project site is well suited for future development of industrial land uses.

MV00170044

4. **Physically Suitable for Proposed Density –** That the site of the proposed land division is physically suitable for the proposed density of the development.

   FACT: The project site is mostly flat and at grade along Perris Boulevard, Indian Street and Grove View Road. The parcel map is designed in accordance with the provisions of the City's Municipal Code. The project site is physically suitable for the subdivision.

5. **Protection of Fish or Wildlife Habitat –** That the design of the proposed land division or the proposed improvements are not likely to cause substantial environmental damage or substantially and unavoidably injure fish or wildlife or their habitat.

   FACT: A Final EIR has been prepared in accordance with the provisions of the California Environmental Quality Act (CEQA), concluding that with mitigation and as conditioned and designed, the proposed subdivision would result in less than significant impacts to Fish and Wildlife resources. The project has also been determined to be consistent with the Multiple Species Habitat Conservation Plan (MSHCP).

6. **Health, Safety and Welfare –** That the design of the proposed land division or the type of improvements are unlikely to cause serious public health problems.

   FACT: As conditioned, the proposed parcel map would not cause serious public health problems. The Eastern Municipal Water District will provide water and sewer services to the project site. There are no known hazardous conditions associated with the property, the design of the land division or the type of improvements.

7. **Easements –** That the design of the land division or the type of improvements will not conflict with easements acquired by the public at large for access through or use of property within the proposed subdivision.

   FACT: The tentative parcel map has been designed to accommodate and not conflict with existing easements on the subject site including utility and storm drain easements.

8. **Consistent with Applicable City Ordinances –** That the proposed land division and the associated design and improvements are consistent with applicable ordinances of the city.

MV00170045

FACT: The tentative parcel map is designed in accordance with the provisions of the City's Municipal Code.

9. **Passive or Natural Heating and Cooling –** That the design of the land division provides, to the extent feasible, for future passive or natural heating and cooling opportunities in the subdivision.

   FACT: The design of this parcel map, to the extent feasible, allows solar access for passive heating and opportunities for placement of shade trees and other vegetation for cooling.

10. **Regional Housing –** That the effect of the proposed land division on the housing needs of the region were considered and balanced against the public service needs of the residents of Moreno Valley and available fiscal and environmental resources.

    FACT: The project does not exceed the planned density, the associated public service demand, or the demand for environmental resources envisioned by the Moreno Valley General Plan. The project will supplement the City's fiscal resources by paying impact fees for public facilities. Additionally, future residents will pay Community Services District fees, property tax, sales tax and other taxes and fees that will be used to provide landscape maintenance as well as police, fire and other public services.

Section 3:

FEES, DEDICATIONS, RESERVATIONS, AND OTHER EXACTIONS

1. **FEES**

   Impact, mitigation and other fees are due and payable under currently applicable ordinances and resolutions. These fees may include but are not limited to: Development Impact Fee, Transportation Uniform Mitigation Fee (TUMF), Multi-species Habitat Conservation Plan (MSHCP) Mitigation Fee, Stephens Kangaroo Habitat Conservation fee, Underground Utilities in lieu Fee, Area Drainage Plan fee, Bridge and Thoroughfare Mitigation fee (Future) and Traffic Signal Mitigation fee. The final amount of fees payable is dependent upon information provided by the applicant and will be determined at the time the fees become due and payable.

   Unless otherwise provided for by this resolution, all impact fees shall be calculated and collected at the time and in the manner provided in Chapter 3.32 of the City of Moreno Valley Municipal

MV00170046

Code or as so provided in the applicable ordinances and resolutions. The City expressly reserves the right to amend the fees and the fee calculations consistent with applicable law.

2. DEDICATIONS, RESERVATIONS, AND OTHER EXACTIONS

The adopted Conditions of Approval for PA08-0097 and PA09-0022, incorporated herein by reference, may include dedications, reservations, and exactions pursuant to Government Code Section 66020 (d) (1).

3. CITY RIGHT TO MODIFY/ADJUST; PROTEST LIMITATIONS

The City expressly reserves the right to establish, modify or adjust any fee, dedication, reservation or other exaction to the extent permitted and as authorized by law.

Pursuant to Government Code Section 66020(d)(1), NOTICE IS FURTHER GIVEN that the 90 day period to protest the imposition of any impact fee, dedication, reservation, or other exaction described in this resolution begins on the effective date of this resolution and any such protest must be in a manner that complies with Section 66020(a) and failure to timely follow this procedure will bar any subsequent legal action to attack, review, set aside, void or annul imposition.

The right to protest the fees, dedications, reservations, or other exactions does not apply to planning, zoning, grading, or other similar application processing fees or service fees in connection with this project and it does not apply to any fees, dedication, reservations, or other exactions of which a notice has been given similar to this, nor does it revive challenges to any fees for which the Statute of Limitations has previously expired.

Section 4:

BE IT FURTHER RESOLVED that the Planning Commission **HEREBY APPROVES** Resolution No. 2012-17:

1. **APPROVING** PA09-0004 (Plot Plan), subject to the attached conditions of approval included as Exhibit A; and

2. **APPROVING** PA09-0012 (Tentative Parcel Map No. 36162), subject to the attached conditions of approval included as Exhibit B.

MV00170047

APPROVED this 12th day of July, 2012.

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects.

COMMUNITY & ECONOMIC DEVELOPMENT DEPARTMENT

Planning Division

P1. Approval of Plot Plan PA09-0004 is subject to certification of an Environmental Impact Report by the City of Moreno Valley.

P2. Plot Plan PA09-0004 has been approved for development of a 1,616,133 square foot warehouse distribution facility, to be built on a 80 acre site within Assessor's Parcel Numbers 316-210-071, -073, -075 and -076. The facility includes 268 dock doors and 44,000 square feet of office. Required parking for this use equates to a total of 589 employee/visitor parking spaces and 368 truck/trailer parking spaces.

P3. Development of the warehouse facility is subject to approval of Tentative Parcel Map No. 36162 and the subsequent recordation of this map.

P4. A mitigation monitoring fee, as provided by City ordinance, shall be paid by the applicant within 30 days of project approval. No City permit or approval shall be issued until such fee is paid. (CEQA)

P5. Bicycle racks shall be provided at a minimum of five (5) percent of the required vehicular parking and shall be located near the designated office area(s).

EXHIBIT A

Timing Mechanisms for Conditions (see abbreviation at beginning of affected condition):

R - Map Recordation	GP - Grading Permits	CO - Certificate of Occupancy or building final
WP - Water Improvement Plans	BP - Building Permits	P - Any permit

Governing Document (see abbreviation at the end of the affected condition):

GP - General Plan	MC - Municipal Code	CEQA - California Environmental Quality Act
Ord - Ordinance	DG - Design Guidelines	Ldscp - Landscape Development Guidelines and Specs
Res - Resolution	UFC - Uniform Fire Code	UBC - Uniform Building Code
	SBM - Subdivision Map Act	

P6. The gates into truck loading and parking areas that are within view of a public street shall be of solid metal construction or wrought iron with mesh to screen the interior of the loading area.

P7. This project shall comply with South Coast Air Quality Management District (SCAQMD) rules related to dust generation (Rule 403) and the use of architectural coatings (Rule 1113).

P8. The design of all swales and basins that are visible from the public right-of-way shall be integrated with the surrounding landscape areas.

P9. Screening walls of decorative block or concrete tilt-up construction shall be provided to fully screen the truck loading and parking area for from view from Perris Boulevard, Indian Street and Grove View Road.

P10. Enhanced landscape shall be provided in the planter areas near each driveway and near the office portions of the facilities.

P11. All loudspeakers, bells, gongs, buzzers or other noise attention devices installed on the project site shall be designed to ensure that the noise level at all property lines will be at or below 55 dBA for consistency with the Municipal Code.

P12. Loading or unloading activities shall be conducted from the truck bays or designated loading areas only. (MC 9.10.140, CEQA)

P13. No outdoor storage is permitted on the project site, except for truck and trailer storage in designated areas within the screened truck courts.

P14. If the proposed project requires blasting, it shall be used only as a last resort. In such cases, it shall be approved by the Fire Marshall, and the developer shall comply with the current City ordinance governing blasting. (Ord)

P15. This approval shall expire three years after the approval date of this project unless used or extended as provided for by the City of Moreno Valley Municipal Code; otherwise it shall become null and void and of no effect whatsoever. Use means the beginning of substantial construction contemplated by this approval within the three-year period, which is thereafter pursued to completion, or the beginning of substantial utilization contemplated by this approval. (MC 9.02.230)

P16. PA09-0004 shall be developed in accordance with the approved plans on file in the Community & Economic Development Department - Planning Division, the Municipal Code regulations, General Plan, the Moreno Valley Industrial Area Plan and the conditions contained herein. Prior to any use of the project site or business activity being commenced thereon, all Conditions of Approval shall be completed to the satisfaction of the City Planning Official. (MC 9.14.020)

P17. The developer, or the developer's successor-in-interest, shall be responsible for maintaining any undeveloped portion of the project site in a manner that provides for the control of weeds, erosion and dust. (MC 9.02.030)

P18. A drought tolerant, low water using landscape palette shall be utilized throughout the project.

P19. All landscaped areas shall be maintained in a healthy and thriving condition, free from weeds, trash and debris. (MC 9.02.030)

P20. Any signs indicated on the submitted plans are not included with this approval. Any signs proposed for this development shall be designed in conformance with the sign provisions of the Municipal Code or approved sign program, if applicable, and shall require separate application and approval by the Community & Economic Development Department - Planning Division. (MC 9.12.020)

Prior to Issuance of Grading Permits

P21. (GP) All site plans, grading plans, landscape and irrigation plans, fence/wall plans, lighting plans and street improvement plans shall be coordinated for consistency with this approval.

P22. (GP) If potential historic, archaeological, or paleontological resources are uncovered during excavation or construction activities at the project site, work in the affected area will cease immediately and a qualified person (meeting the Secretary of the Interior's standards (36CFR61)) shall be consulted by the applicant to evaluate the find, and as appropriate recommend alternative measures to avoid, minimize or mitigate negative effects on the historic, prehistoric, or paleontological resource. Determinations and recommendations by the consultant shall be implemented as deemed appropriate by the Community & Economic Development Director, in consultation with the State Historic Preservation Officer (SHPO) and any and all affected Native American Tribes before any further work commences in the affected area.

If human remains are discovered, work in the affected area shall cease immediately and the County Coroner shall be notified. If it is determined that the remains are potentially Native American, the California Native American Heritage Commission and any and all affected Native American Indians tribes such as the Morongo Band of Mission Indians or the Pechanga Band of Luiseno Indians shall be notified and appropriate measures provided by State law shall be implemented. (GP Objective 23.3, DG, CEQA).

P23. (GP) Prior to the issuance of grading permits, final erosion control landscape and irrigation plans for all cut or fill slopes over 3 feet in height shall be submitted to the Planning Division for review and approval for the phase in process. The plans shall be designed in accordance with the slope erosion plan as required by the City Engineer for that phase. Man-made slopes greater than 10 feet in height shall be

"land formed" to conform to the natural terrain and shall be landscaped and stabilized to minimize visual scarring. (GP Objective 1.5, MC 9.08.080, DG)

P24. (GP) Prior to approval of any grading permit, the developer shall submit for review and approval of a tree plan to the Planning Division. The plan shall identify all mature trees (4 inch trunk diameter or larger) on the subject property, City right-of-way or Caltrans right-of-way. Using the grading plan as a base, the plan shall indicate trees to be relocated, retained, and removed. Replacement trees shall be: shown on the plan; be a minimum size of 24 inch box; and meet a ratio of three replacement trees for each mature tree removed or as approved by the Community Development Director. (GP Objective 4.4, 4.5, DG)

P25. (GP) Prior to issuance of grading permits, the developer shall pay the applicable Stephens' Kangaroo Rat (SKR) Habitat Conservation Plan mitigation fee. (Ord)

P26. (GP) Prior to approval of any grading permits, plans for any security gate system shall be submitted to the Community Development Department - Planning Division for review and approval.

P27. (GP) If a median is required, then prior to approval of any grading permits, final median enhancement/landscape/irrigation plans shall be submitted to the Community Development Department - Planning Division and Public Works Department – Special Districts for review and approval by each division. Timing of installation shall be determined by PW- Special Districts. (GP - Circulation Master Plan)

P28. (GP) Prior to issuance of any grading permits, mitigation measures contained in the Mitigation Monitoring Program approved with this project shall be implemented as provided therein.

P29. (GP) Prior to the issuance of grading permits, the grading plan shall show decorative treatment for all driveway ingress/egress locations of the project. Accessible pedestrian pathways interior to the site cannot be painted. If delineation is necessary, then an alternative material is required.

P30. (GP) Prior to the issuance of a grading permit, all required planter areas, curbs, including twelve-inch concrete step outs, and required parking space striping shall be shown on the precise grading plan.

P31. (GP) Prior to the issuance of grading permits, the following burrowing owl survey requirements shall be incorporated into the grading plans in accordance with the Riverside County Multi-species Habitat Conservation Plan: Within 30 days of and prior to disturbance, a burrowing owl focused survey shall be conducted by a qualified biologist using accepted protocols. The survey shall be submitted to the Planning Division for review and approval.

P32. (GP) Prior to issuance of grading permits, landscape plans (trees, shrubs and groundcover) for basins maintained by an POA or other private entity shall be submitted to the Planning Division for review and approval for the sides and/or slopes. A hydroseed mix with irrigation is acceptable for the bottom of all the basin areas. All detention basins shall include trees, shrubs and groundcover up to the concreted portion of the basin. A solid decorative wall with pilasters, tubular steel fence with pilasters or other fence or wall approved by the Community Development Director is required to secure all water quality and detention basins more than 18 inches in depth.

P33. (GP) Prior to issuance of grading permits, the developer shall submit wall/fence plans to the Planning Division for review and approval as follows:

- **A. A maximum 3 foot high decorative wall in lieu of a hedge or berm may be placed in setback areas adjacent to a parking lot.**
- **B. Any proposed retaining walls shall also be decorative in nature, while the combination of retaining and other walls on top shall not exceed the height requirement for the specific plan and/or Municipal Code.**
- **C. A 14 foot tall solid wall of decorative block with pilasters and a cap or concrete tilt-up construction shall be provided to screen the trucks, parked trailers and the loading areas and loading docks from view from Perris Boulevard, Indian Street and Grove View Road.**
- **D. An 8 foot tall chain link fence with slats is required along the southern property line along the Riverside County Flood Control maintenance road.**

<u>Prior to Issuance of Building Permits</u>

P34. (BP) Prior to issuance of building permits, the Community & Economic Development Department - Planning Division shall review and approve the location and method of enclosure or screening of transformer cabinets, commercial gas meters and back flow preventers as shown on the final working drawings. Location and screening shall comply with the following criteria: transformer cabinets and commercial gas meters shall not be located within required setbacks and shall be screened from public view either by architectural treatment or with landscaping; multiple electrical meters shall be fully enclosed and incorporated into the overall architectural design of the building(s); back-flow preventers shall be screened by landscaping that will provide complete screening upon maturity. (GP Objective 43.30, DG)

P35. (BP) Prior to issuance of building permits, screening details shall be addressed on plans for roof top equipment and trash enclosures submitted for Community & Economic Development Department - Planning Division review and approval. All equipment shall be completely screened so as not to be visible from public view, and the screening shall be an integral part of the building. For trash enclosures, landscaping shall be included on at least three sides. The trash enclosure, including any roofing, shall be compatible with the architecture for the building(s). (GP Objective 43.6, DG)

P36. (BP) Prior to issuance of building permits, two copies of a detailed, on-site, computer generated, point-by-point comparison lighting plan, including exterior building, parking lot, and landscaping lighting, shall be submitted to the Community & Economic Development Department - Planning Division for review and approval. The lighting plan shall be generated on the plot plan and shall be integrated with the final landscape plan. The plan shall indicate the manufacturer's specifications for light fixtures used and shall include style, illumination, location, height and method of shielding. The lighting shall be designed in such a manner so that it does not exceed 0.5 foot candles illumination beyond at the property line. The lighting level for all parking lots or structures shall be a minimum coverage of one foot-candle of light with a maximum of eight foot-candles. After the third plan check review for lighting plans, an additional plan check fee will apply. (MC 9.08.100, DG)

P37. (BP) Prior to issuance of building permits or as permitted by current City policy, the developer or developer's successor-in-interest shall pay all applicable impact fees, including but not limited to Transportation Uniform Mitigation fees (TUMF), Multi-species Habitat Conservation Plan (MSHCP) mitigation fees, and the City's adopted Development Impact Fees. (Ord)

P38. (BP) Prior to issuance of building permits, final landscaping and irrigation plans shall be submitted to the Community & Economic Development Department - Planning Division for review. All landscape plans shall be approved prior to the release of any building permits for the site. After the third plan check review for landscape plans, an additional plan check fee shall apply. The plans shall be prepared in accordance with the City's Landscape Standards and Specifications and shall include:

A. A landscape berm, hedge or a maximum 3 foot decorative wall is required adjacent to parking areas along public rights-of-way.
B. All finger and end planters shall be included at an interval of one per 12 parking stalls, be a minimum 5' x 16', and include additional 12" concrete step-outs and 6" curbing. (MC9.08.230, City's Landscape Standards)
C. All diamond planters shall be included at an interval of one per 3 parking stalls.
D. Drought tolerant landscape shall be provided. Sod shall be limited to public gathering areas only and not be included along the perimeter of the project site.
E. On site trees shall be planted at an equivalent of one (1) tree per thirty (30) linear feet of building dimension. Trees may be massed for pleasing aesthetic effects.
F. **Enhanced landscaping shall be included at all driveway and corner locations.**
G. All site perimeter and parking lot landscape and irrigation shall be installed prior to the release of certificate of any occupancy permits for the site or pad in question.
H. The review of all utility boxes, transformers etc. shall be coordinated to provide adequate screening from public view. (Landscape Guidelines)

I. **Street trees planted at 40 feet on center spacing shall be provided along the site's Perris Boulevard, Indian Street and Grove View Road frontages.**

J. **Along property boundaries visible from the public view and accessible to the general public, trees shall be planted at a rate of one tree per 30 linear feet of the interior property line. Tree clusters may satisfy this requirement.**

K. **The design of all swales and basins that are visible from the public right-of-way shall be integrated with the surrounding landscape areas.**

P44. (BP) Prior to the issuance of building permits, the landscape plans shall include landscape treatment for trash enclosures located outside of a truck court, to include landscape on three sides, and trash enclosures shall include decorative enhancements such as an enclosed roof and other decorative features that are consistent with the architecture of the proposed commercial buildings on the site, subject to the approval of the Community & Economic Development Director.

P45. (BP) Prior to the issuance of building permits, all fences and walls required or proposed on site, shall be approved by the Community & Economic Development Director. (MC 9.08.070)

P46. (BP) Prior to the issuance of building permits, downspouts will be interior to the building, or if exterior, integrated into the architecture of the building to include compatible colors and materials to the satisfaction of the Community & Economic Development Director.

P47. (BP) Prior to the issuance of building permits the building site plan shall include decorative concrete or pavers for all driveway ingress/egress locations for the project.

P48. (BP) Prior to issuance of building permits, a final map for Tentative Parcel Map No. 36162 (PA09-0012) must be approved and recorded and all conditions of approval related to the parcel map must be satisfied.

P49. (BP) Prior to issuance of any building permits, mitigation measures contained in the Mitigation Monitoring Program approved with this project shall be implemented as provided therein. (CEQA)

<u>Prior to Issuance of Certificate of Occupancy or Building Final</u>

P50. (CO) Prior to issuance of any Certificates of Occupancy or building final, mitigation measures contained in the Mitigation Monitoring Program approved with this project shall be implemented as provided therein. (CEQA) (Advisory)

P51. (CO) Prior to the issuance of Certificates of Occupancy or building final, all required and proposed fences and walls shall be constructed according to the approved plans on file in the Community & Economic Development Department – Planning Division. (MC 9.080.070).

P52. (CO) Prior to issuance of Certificate of Occupancy or building final, installed landscaping and irrigation shall be reviewed by the Community & Economic Development Department - Planning Division. The landscaping shall be installed in accordance with the City's Landscape Standards and the approved landscape plans.

P53. (CO) All rooftop equipment shall be appropriately screened and not visible from the public rights of way.

MITIGATION MEASURES

Air Quality

P54. **4.2.6.1A** Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

P55. **4.2.6.1B** Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

P56. **4.2.6.1C** Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

P57. **4.2.6.1D** All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.

P58. **4.2.6.1E** The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.

P59. **4.2.6.1F** The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM10 and PM2.5 fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.

P60. **4.2.6.1G** Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive construction areas (previously graded areas inactive for ten days or more).

P61. **4.2.6.1H** The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by not allowing construction equipment to be left idling for more than five minutes (per California law).

P62. **4.2.6.1I** The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).

P63. **4.2.6.1J** If available, the project applicant shall use "Low-Volatile Organic Compounds" paints, coatings, and solvents with a VOC content lower than required under Rule 1113 (not to exceed 150 grams/liter; 1.25 pounds/gallon). High Pressure Low Volume (HPLV) applications of paints, coatings, and solvents shall be consistent with South Coast Air Quality Management District Rule 1113. Alternatively, the project applicant shall use materials that do not require painting or are pre-painted.

P64. **4.2.6.1K** Grading plans, construction specifications and bid documents shall also include the following notations:

- Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;
- Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;
- Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;
- The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;
- The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;

- High pressure injectors shall be provided on diesel construction equipment where feasible;
- Engine size of construction equipment shall be limited to the minimum practical size;
- Substitute gasoline-powered for diesel-powered construction equipment where feasible;
- Use electric construction equipment where feasible;
- Install catalytic converters on gasoline-powered equipment where feasible;
- Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement;
- Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;
- Lunch vendor services shall be permitted onsite during construction to minimize the need for offsite vehicle trips;
- All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.
- Suspend use of all construction equipment operations during second stage smog alerts.

P65. **4.2.6.1L** Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on-site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM10 (fugitive dust) generation or other construction-related air quality issues.

P66. **4.2.6.1M** All project entrances shall be posted with signs which state:

- Truck drivers shall turn off engines when not in use;
- Diesel delivery trucks servicing the project shall not idle for more than three (3) minutes; and
- Telephone numbers of the building facilities manager and CARB, to report violations.

P67. **4.2.6.1N** When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.

P68. **4.2.6.1O** All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are

carried to adjacent streets.

P69. **4.2.6.1P** Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.

P70. **4.2.6.1Q.** Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.

P71. **4.2.6.1R** All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.

P72. **4.2.6.1S** Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.

P73. **4.2.6.1T** Reroute construction trucks away from congested streets and sensitive receptor areas.

P74. **4.2.6.3A** Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:

- Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.
- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.
- Incorporate dual-paned or other energy efficient windows.
- Incorporate energy efficient space heating and cooling equipment.
- Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards, as deemed acceptable by the City. Use automatic devices to turn off lights when they are not needed.

- To the extent that they are compatible with landscaping guidelines established by the City, use shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings at the project site.
- Use paints and a surface color palette for the project emphasizing light and off-white colors which reflect heat away from the buildings.
- Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs.
- Reduce energy demand associated with potable water conveyance using the following:
  - Landscaping palette emphasizing drought-tolerant plants;
  - Use of water-efficient irrigation techniques; and,
  - U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.
- Provide on-site bicycle storage/parking consistent with City of Moreno Valley requirements.
- Provide on-site showers (one for males and one for females). Provide lockers for employees.
- Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.
- Provide preferential parking for carpools, vanpools or other alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools on the project site plan.
- Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations on the project building plans.
- Implement compressed workweek schedules;
- Achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers.
- Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it

reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers.

- Use of fleet vehicles conforming to 2010 air quality standards or better.
- Installation of catalytic converters on gasoline-powered equipment.
- Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets;
- Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles;
- Provision of preferential parking for EV and CNG vehicles;
- Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance;
- Use of electric (instead of diesel or gasoline-powered) yard trucks;
- Use of SmartWay 1.25 rated trucks.
- Provide a display case or kiosk displaying transportation information including the RTA bus schedule in a prominent area accessible to employees.
- Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.

P75. **4.2.6.3B** The project shall be designed to facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that are dedicated to the collection and storage of recyclable materials including: paper, cardboard, glass, plastics, and metals. Locations of proposed recyclable materials collection areas are subject to review and approval by the City. Prior to Final Site Plan approval, locations of proposed recyclable materials collection areas shall be delineated on the project site plan.

Biological Resources

P76. **Mitigation Measure BIO-1:** No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction survey shall be completed by a qualified biologist. The survey will identify special status avian species (if any) within the area of intended disturbance. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance, **Mitigation Measure BIO-3** shall apply.

P77. **Mitigation Measure BIO-2:** No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction burrowing owl survey shall be completed by a qualified biologist for the planned disturbance area. The pre-construction burrowing owl surveys may be conducted as part of the survey required in

Mitigation Measure BIO-1. A report detailing the findings of the pre-construction survey shall be submitted to the City prior to the initiation of ground-disturbing activities. In the event no burrowing owls are identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, **Mitigation Measures BIO-3** and **BIO-4** shall apply.

P78. **Mitigation Measures BIO-3.** If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.

P79. **Mitigation Measure BIO-4:** If active burrowing owl burrows are detected outside the breeding season, then passive and/or active relocation may be approved following consultation with the CDFG and/or USFWS. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure that animals do not re-enter the holes/dens.

Cultural Resources

P80. **Mitigation Measure CUL-1:** Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued. In the event fossiliferous deposits are encountered, the following measures shall be implemented:

- Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources.
- Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored.

- Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.
- Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities.
- Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources

Geology and Soils

P81. Mitigation Measure GEO-1: Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure.

The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site.

The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed.

The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm.

It should be noted that the above measure may be modified by the Final Geotechnical or Soils Report.

P82. **Mitigation Measure GEO-2:** Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans.

Greenhouse Gases and Global Climate Change

P83. **4.3.6.1A** Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that building features have been incorporated in building plans as required by Title 24 of the California Code of Regulations. These features include but are not limited to the following:

- Exterior windows in the office areas shall utilize window treatments for efficient energy conservation.
- Per CALGreen Code requirements, water-efficient fixtures and appliances, including but not limited to low-flow faucets, dual-flush toilets minimizing water consumption by 20 percent from the Building Standards Code baseline water consumption shall be used.
- Per CALGreen Code requirements, a Commissioning Plan shall be prepared and all building systems (e.g., heating, ventilation, and air-conditioning [HVAC], irrigation systems, lighting, water heating) shall be commissioned by the Commissioning Authority.
- Per CALGreen Code, restrict watering methods (e.g., prohibit systems that apply water to non-vegetated surfaces) and control runoff.

P84. **4.3.6.1B** Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the design and construction of the project:

- Encourage use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project.
- Encourage use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project.
- Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions.

- Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment where feasible. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants.
- Design the project building to exceed the California Building Code's (CBC) 2008 Title 24 energy standard by 20%, including, but not limited to, any combination of the following:
  - Increase insulation such that heat transfer and thermal bridging is minimized.
  - Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.
  - Incorporate ENERGY STAR or better rated windows in the office area, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment.
- Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. The landscaping plan shall be prepared by a registered landscape architect who will consider the following:
  - Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.
  - Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.
- Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings.
- Install light-colored "cool" roof and cool pavements.
- Install energy-efficient heating and cooling systems, appliances and equipment, and control systems.
- Install solar or light-emitting diodes (LEDs) for outdoor lighting.
- Install electrical outlets on the exterior walls of the warehouse/office building (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.

P85. **4.3.6.1C** Prior to the issuance of occupancy permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the operation of the project:

- The project applicant shall use low Global Warming refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO_2]) for refrigeration and fire suppression equipment.
- Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows in the office areas.

- Devise a comprehensive water conservation strategy appropriate for the project and its location. The strategy may include the following, plus other innovative measures that may be appropriate:
- Install drought tolerant plants for landscaping.
- Use reclaimed water for landscape irrigation within the project. Install the infrastructure to deliver and use reclaimed water.
- Install water-efficient irrigations systems, such as weather-based and soil-moisture-based irrigation controllers and sensors for landscaping according to the California Department of Water Resources Model Efficient Landscape Ordinance.
- Provide employee education about reducing waste and available recycling services.

Hydrology and Water Quality

P86. **Mitigation Measure HYD-01:** Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall provide evidence to the City that a Notice of Intent (NOI) with the Regional Water Quality Control Board has been filed to be covered under the State NPDES General Construction Permit for discharge of stormwater associated with construction activities.

P87. **Mitigation Measure HYD-02:** Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall submit to the State Water Quality Control Board, a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. Additionally, the SWPPP shall identify structural and nonstructural BMPs to control sediment and non-visible discharges from the site. BMPs to be implemented in the SWPPP may include but shall not be limited to the following:

Sediment discharges from the site may be controlled by the following: gravel bags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge control devices. The construction and condition of the BMPs will be periodically inspected during construction, and repairs will be made when necessary as required by the SWPPP.

Materials that have the potential to contribute non-visible pollutants to stormwater must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas.

All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate any discharge from the site. Stockpiles will be surrounded by silt fences.

The SWPPP will include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance.

Additional BMPs and erosion control measures will be documented in the SWPPP and utilized if necessary.

The SWPPP will be kept on site for the entire duration of project construction and will also be available to the local RWQCB for inspection at any time.

In the event that it is not feasible to implement the above BMPs, the City of Moreno Valley can make a determination that other BMPs will provide equivalent or superior treatment either on or off site.

P88. **Mitigation Measure HYD-03:** Prior to the issuance of grading permits, the project proponent shall provide evidence to the City that the following provisions have been added to construction contracts for the project:

- The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the SWPPP. Weekly inspections shall be performed on sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and submitted to the City for inspection. In addition, the Contractor will also be required to maintain an inspection log and have the log on site to be reviewed by the City of Moreno Valley and the representatives of the Regional Water Quality Control Board.

P89. **Mitigation Measure HYD-04:** Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley for a Final Water Quality Management Plan (F-WQMP). The F-WQMP shall specifically identify pollutants of concern, site design, source control, and treatment control BMPs that shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.

P90. **Mitigation Measure HYD-05:** Prior to grading plan approval and the issuance of a grading permit, the project proponent shall submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed project site are less than or equal to pre-development flows.

Noise

P91. **4.4.6.1A** During all project site excavation and grading on site, the project contractor shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers consistent with manufacturers' standards.

P92. **4.4.6.1B** The project contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest to the project site.

P93. **4.4.6.1C** The construction contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise sources and noise-sensitive receptors nearest to the project site during all project construction.

P94. **4.9.6.1D** During all project site construction activities, the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer. For grading activity, the hours are limited to between 7 am and 6 pm weekdays and 8 am to 4 pm on weekends and holidays.

Transportation

P95. **4.5.6.1A.** Prior to the issuance of building permits, the project applicant shall participate in the City of Moreno Valley Development Impact (DIF) Fee Program and pay the project's fair share for local circulation improvements as outlined in the VIP Moreno Valley Project Traffic Study. The City shall ensure that the intersection and street improvements outlined in the VIP Moreno Valley Project Traffic Study will be constructed pursuant to the timeframes established by the City of Moreno Valley Development Impact Fee Program.

P96. **4.5.6.1B.** Prior to the issuance of building permits, the project applicant shall participate in the County of Riverside Transportation Uniform Mitigation Fee (TUMF) Program and pay the project's fair share for regional circulation improvements. The City shall ensure that the intersection and street improvements outlined in the VIP Moreno Valley Project Traffic Study will be constructed pursuant to the timeframe established by the County of Riverside TUMF Program.

P97. **4.5.6.2A.** Prior to the issuance of occupancy permits, the project applicant shall have constructed the site access roadway improvements outlined below.

Indian Street/South Project Driveway: Restripe to convert center turn lane on Indian Street to a two-way left-turn lane. This location does not meet a peak hour signal warrant. This is a site-adjacent improvement to be constructed by the project applicant.

<u>Building and Safety Division</u>

B1. The above project shall comply with the current California Codes (CBC, CEC, CMC and the CPC) as well as all other city ordinances. All new projects shall provide a soils report. Plans shall be submitted to the Building Department as a separate submittal.

COMMERCIAL, INDUSTRIAL, MULTI-FAMILY PROJECTS INCLUDING CONDOMINIUMS, TOWNHOMES, DUPLEXES AND TRIPLEX BUILDINGS REQUIRE THE FOLLOWING:

Prior to final inspection, all plans will be placed on a CD Rom for reference and verification. Plans will include "as built" plans, revisions and changes. The CD will also include Title 24 energy calculations, structural calculations and all other pertinent information. It will be the responsibility of the developer and or the building or property owner(s) to bear all costs required for this process. The CD will be presented to the Building Department for review prior to final inspection and building occupancy. The CD will become the property of the Moreno Valley Building Department at that time. In addition, a site plan showing the path of travel from public right of way and building to building access with elevations will be required.

B2. (BP) Prior to the issuance of a building permit, the applicant shall submit a properly completed "Waste Management Plan" (WMP), as required, to the Compliance Official (Building Official) as a portion of the building or demolition permit process.

SCHOOL DISTRICT

S1. (BP) Prior to issuance of building permits, the developer shall provide to the Community Development Director a written certification by the affected school district that either: (1) the project has complied with the fee or other exaction levied on the project by the governing board of the district, pursuant to Government Code Section 65996; or (2) the fee or other requirement does not apply to the project.

UNITED STATES POSTAL SERVICE

PO1. (BP) Prior to the issuance of building permits, the developer shall contact the U.S. Postal Service to determine the appropriate type and location of mailboxes.

FIRE PREVENTION BUREAU

1. **Please complete and return attached fire flow letter.**
2. The following Standard Conditions shall apply.

With respect to the conditions of approval, the following fire protection measures shall be provided in accordance with Moreno Valley City Ordinances and/or recognized fire protection standards:

F1. Final fire and life safety conditions will be addressed when the Fire Prevention Bureau reviews building plans. These conditions will be based on occupancy, use, California Building Code (CBC), California Fire Code (CFC), and related codes, which are in force at the time of building plan submittal.

F2. The Fire Prevention Bureau is required to set a minimum fire flow for the remodel or construction of all commercial buildings per CFC Appendix B and Table B105.1. The applicant/developer shall provide documentation to show there exists a water system capable of delivering 4000 GPM for 4 hour(s) duration at 20-PSI residual operating pressure. The required fire flow may be adjusted during the approval process to reflect changes in design, construction type, or automatic fire protection measures as approved by the Fire Prevention Bureau. Specific requirements for the project will be determined at time of submittal. (CFC 508.3, Appendix B and MVMC 8.36.100 Section D) **The 50% reduction in fire flow was granted for the use of fire sprinklers throughout the facility. The reduction shall only apply to fire flow, hydrant spacing shall be per the fire flow requirements listed in CFC Appendix B and C.**

F3. Industrial, Commercial, Multi-family, Apartment, Condominium, Townhouse or Mobile Home Parks. A combination of on-site and off-site super enhanced fire hydrants (6" x 4" x 4" x 2 ½") shall not be closer than 40 feet and more than 150 feet from any portion of the building as measured along approved emergency vehicular travel ways. The required fire flow shall be available from any adjacent fire hydrant(s) in the system. Where new water mains are extended along streets where hydrants are not needed for protection of structures or similar fire problems, super or enhanced fire hydrants as determined by the fire code official shall be provided at spacing not to exceed 500 feet of frontage for transportation hazards. (CFC 508.5.7 & MVMC 8.36.050 Section O and 8.36.100 Section E)

F4. During phased construction, dead end roadways and streets which have not been completed shall have a turn-around capable of accommodating fire apparatus. (CFC 503.1 and 503.2.5)

F5. Prior to issuance of Building Permits, the applicant/developer shall provide the Fire Prevention Bureau with an approved site plan for Fire Lanes and signage. (MVMC 8.36.050 and CFC 501.3)

F6. Prior to construction and issuance of building permits, all locations where structures are to be built shall have an approved Fire Department emergency vehicular access road (all weather surface) capable of sustaining an imposed load of 80,000 lbs. GVW, based on street standards approved by the Public Works Director and the Fire Prevention Bureau. (CFC 501.4 and MVMC 8.36.050 Section A)

F7. Prior to construction and issuance of Building Permits, fire lanes and fire apparatus access roads shall have an unobstructed width of not less than twenty–four (24) or thirty (30) feet as approved by the Fire Prevention Bureau and an unobstructed vertical clearance of not less the thirteen (13) feet six (6) inches. (CFC 503.2.1.1 and MVMC 8.36.050)

F8. Prior to construction, all roads, driveways and private roads shall not exceed 12 percent grade. (CFC 503.2.7 and MVMC 8.36.050)

F9. If construction is phased, each phase shall provide an approved emergency vehicular access way for fire protection prior to any building construction. (CFC 501.4 and MVMC 8.36.050 Section A)

F10. Prior to construction, all locations where structures are to be built shall have an approved Fire Department access based on street standards approved by the Public Works Director and the Fire Prevention Bureau. (CFC 501.3 and MVMC 8.36.050)

F11. Prior to building construction, dead end roadways and streets which have not been completed shall have a turnaround capable of accommodating fire apparatus. (CFC 503.2.5 and MVMC 8.36.050)

F12. Prior to issuance of Building Permits, the applicant/developer shall participate in the Fire Impact Mitigation Program. (Fee Resolution as adopted by City Council)

F13. Prior to issuance of Building Permits, the applicant/developer shall furnish one copy of the water system plans to the Fire Prevention Bureau for review. Plans shall:

a) Be signed by a registered civil engineer or a certified fire protection engineer;
b) Contain a Fire Prevention Bureau approval signature block; and
c) Conform to hydrant type, location, spacing of new and existing hydrants and minimum fire flow required as determined by the Fire Prevention Bureau.

After the local water company signs the plans, the originals shall be presented to the Fire Prevention Bureau for signatures. The required water system, including fire hydrants, shall be installed, made serviceable, and be accepted by the Moreno Valley Fire Department prior to beginning construction. They shall be maintained accessible.

Existing fire hydrants on public streets are allowed to be considered available. Existing fire hydrants on adjacent properties shall not be considered available unless

fire apparatus access roads extend between properties and easements are established to prevent obstruction of such roads. (CFC 508.1 and MVMC 8.36.100)

F14. Prior to issuance of Certificate of Occupancy or Building Final, "Blue Reflective Markers" shall be installed to identify fire hydrant locations in accordance with City specifications. (CFC 510.1)

F15. Prior to issuance of Certificate of Occupancy or Building Final, all commercial buildings shall display street numbers in a prominent location on the street side and rear access locations. The numerals shall be a minimum of twelve (12) inches in height for buildings and six (6) inches in height for suite identification on a contrasting background. Unobstructed lighting of the address(s) shall be by means approved by the Fire Prevention Bureau and Police Department. In multiple suite centers (strip malls), businesses shall post the name of the business on the rear door(s). (CFC 505.1)

F16. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer shall install a fire sprinkler system based on square footage and type of construction, occupancy or use. Fire sprinkler plans shall be submitted to the Fire Prevention Bureau for approval prior to installation. (CFC Chapter 9)

F17. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer shall install a fire alarm system monitored by an approved Underwriters Laboratory listed central station based on a requirement for monitoring the sprinkler system, occupancy or use. Fire alarm panel shall be accessible from exterior of building in an approved location. Plans shall be submitted to the Fire Prevention Bureau for approval prior to installation. (CFC Chapter 9 and MVMC 8.36.070)

F18. Prior to issuance of a Certificate of Occupancy or Building Final, a "Knox Box Rapid Entry System" shall be provided. The Knox-Box shall be installed in an accessible location approved by the Fire Chief. The Knox-Box shall be supervised by the alarm system and all exterior security emergency access gates shall be electronically operated and be provided with Knox key switches for access by emergency personnel. (CFC 506.1)

F19. Prior to issuance of Certificate of Occupancy, approval shall be required from the County of Riverside Community Health Agency (Department of Environmental Health) and Moreno Valley Fire Prevention Bureau to maintain, store, use, handle materials, or conduct processes which produce conditions hazardous to life or property, and to install equipment used in connection with such activities. (CFC 2701.5)

F20. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer must submit a simple plot plan, a simple floor plan, and other plans as requested, each as an electronic file in .dwg format, to the Fire Prevention Bureau. Alternate file formats may be acceptable with approval by the Fire Chief.

F21. The angle of approach and departure for any means of Fire Department access shall not exceed 1 ft drop in 20 ft (0.3 m drop in 6 m), and the design limitations of the fire apparatus of the Fire Department shall be subject to approval by the AHJ. (CFC 503.2.7 and MVMC 8.36.050 Section I)

F22. Prior to issuance of the building permit for development, independent paved access to the nearest paved road, maintained by the City shall be designed and constructed by the developer within the public right of way in accordance with City Standards. (MVMC 8.36.050)

F23. Prior to construction, "private" driveways over 150 feet in length shall have a turn-around as determined by the Fire Prevention Bureau capable of accommodating fire apparatus. Driveway grades shall not exceed 12 percent. (CFC 503 and MVMC 8.36.050)

F24. Complete plans and specifications for fire alarm systems, fire-extinguishing systems (including automatic sprinklers or standpipe systems), clean agent systems (or other special types of automatic fire-extinguishing systems), as well as other fire-protection systems and appurtenances thereto shall be submitted to the Moreno Valley Fire Prevention Bureau for review and approval prior to system installation. Submittals shall be in accordance with CFC Chapter 9 and associated accepted national standards.

F25. A permit is required to maintain, store, use or handle materials, or to conduct processes which produce conditions hazardous to life or property, or to install equipment used in connection with such activities. Such permits shall not be construed as authority to violate, cancel or set aside any of the provisions of this code. Such permit shall not take the place of any license required by law. Applications for permits shall be made to the Fire Prevention Bureau in such form and detail as prescribed by the Bureau. Applications for permits shall be accompanied by such plans as required by the Bureau. Permits shall be kept on the premises designated therein at all times and shall be posted in a conspicuous location on the premises or shall be kept on the premises in a location designated by the Fire Chief. Permits shall be subject to inspection at all times by an officer of the fire department or other persons authorized by the Fire Chief in accordance with Appendix Chapter 1 and MVMC 8.36.100.

F26. Approval of the safety precautions required for buildings being constructed, altered or demolished shall be required by the Fire Chief in addition to other approvals required for specific operations or processes associated with such construction, alteration or demolition. (CFC Chapter 14 & CBC Chapter 33)

F27. Prior to issuance of Certificate of Occupancy, permits are required to store, dispense, use or handle hazardous material. Each application for a permit shall include a hazardous materials management plan (HMMP). The location of the HMMP shall be posted adjacent to (other) permits when an HMMP is provided. The HMMP shall include a facility site plan designating the following:

a) Storage and use areas;
b) Maximum amount of each material stored or used in each area;
c) Range of container sizes;
d) Locations of emergency isolation and mitigation valves and devises;
e) Product conveying piping containing liquids or gases, other than utility-owned fuel gas lines and low-pressure fuel gas lines;
f) On and off positions of valves for valves which are of the self-indicating type;
g) Storage plan showing the intended storage arrangement, including the location and dimensions of aisles. The plans shall be legible and approximately to scale. Separate distribution systems are allowed to be shown on separate pages; and
h) Site plan showing all adjacent/neighboring structures and use.

NOTE: Each application for a permit shall include a hazardous materials inventory statement (HMIS).

F28. Before a Hazardous Materials permit is issued, the Fire Chief shall inspect and approve the receptacles, vehicles, buildings, devices, premises, storage spaces or areas to be used. In instances where laws or regulations are enforceable by departments other than the Fire Prevention Bureau, joint approval shall be obtained from all departments concerned. (CFC Appendix H)

F29. Construction or work for which the Fire Prevention Bureau's approval is required shall be subject to inspection by the Fire Chief and such construction or work shall remain accessible and exposed for inspection purposes until approved. (CFC Section 106)

F30. The Fire Prevention Bureau shall maintain the authority to inspect, as often as necessary, buildings and premises, including such other hazards or appliances designated by the Fire Chief for the purpose of ascertaining and causing to be corrected any conditions which would reasonably tend to cause fire or contribute to its spread, or any violation of the purpose or provisions of this code and of any other law or standard affecting fire safety. (CFC Section 106)

F31. Permit requirements issued, which designate specific occupancy requirements for a particular dwelling, occupancy, or use, shall remain in effect until such time as amended by the Fire Chief. (CFC Section 104)

F32. In accordance with the California Fire Code Appendix Chapter 1, where no applicable standards or requirements are set forth in this code, or contained within other laws, codes, regulations, ordinances or bylaws adopted by the jurisdiction, compliance with applicable standards of the National Fire Protection Association or other nationally recognized fire safety standards as are approved shall be deemed as prima facie evidence of compliance with the intent of this code as approved by the Fire Chief. (CFC Section 102.7)

F33. Any alterations, demolitions, or change in design, occupancy and use of buildings or site will require plan submittal to the Fire Prevention Bureau with review and approval prior to installation. (CFC Appendix Chapter 1)

F34. Emergency and Fire Protection Plans shall be provided when required by the Fire Prevention Bureau. (CFC Section 105)

F35. Prior to construction, all traffic calming designs/devices must be approved by the Fire Marshal and City Engineer.

FIRE FLOW LETTER

Date:	02/24/2009	**Address:**	
Case Number:	PA09-0004	**A.P.N.:**	316-210-071, 073, 075, 076

This is certification the water system is capable of meeting the following required fire flows as determined by the California Fire Code Appendix B.

Based on the information provided on the above referenced case. The fire flow required for this project will be 4000 G.P.M. for duration of 4-HOURS measured at 20-psi residual pressure.

The required fire flow may be adjusted during the approval process to reflect changes in design, construction type or automatic fire protection measures as approved by the Fire Prevention Bureau.

Applicant/ Developer: _____

By: _____ **Date:** _____

Title: _____

WATER AGENCY APPROVAL

Name of Agency: _____

Address: _____

Telephone: _____ **Date:** _____

By: _____ **Title:** _____

NOTE: **THE COMPLETION AND SUBMITTAL OF THIS LETTER TO THE FIRE PREVENTION BUREAU SHALL NOT BE CONSTRUED AS APPROVAL FOR THE INSTALLATION OF THE REQUIRED FIRE HYDRANT (S) AND/OR WATER SYSTEM.**

COMMUNITY & ECONOMIC DEVELOPMENT DEPARTMENT – LAND DEVELOPMENT DIVISION

The following are the Land Development Division Conditions of Approval for this project and shall be completed at no cost to any government agency. All questions regarding the intent of the following conditions shall be referred to the Land Development Division.

General Conditions

LD1. (G) The developer shall comply with all applicable City ordinances and resolutions including the City's Municipal Code (MC) and if subdividing land, the Government Code (GC) of the State of California, specifically Sections 66410 through 66499.58, said sections also referred to as the Subdivision Map Act (SMA). (MC 9.14.010)

LD2. (G) It is understood that the tentative map correctly shows all existing easements, traveled ways, and drainage courses, and that their omission may require the map or plans associated with this application to be resubmitted for further consideration. (MC 9.14.040)

LD3. (G) In the event right-of-way or offsite easements are required to construct offsite improvements necessary for the orderly development of the surrounding area to meet the public health and safety needs, the developer shall make a good faith effort to acquire the needed right-of-way in accordance with the Land Development Division's administrative policy. In the event that the developer is unsuccessful, he shall enter into an agreement with the City to acquire the necessary right-of-way or offsite easements and complete the improvements at such time the City acquires the right-of-way or offsite easements which will permit the improvements to be made. The developer shall be responsible for all costs associated with the right-of-way or easement acquisition. (GC 66462.5)

LD4. (G) If improvements associated with this project are not initiated within two years of the date of approval of the Public Improvement Agreement, the City Engineer may require that the improvement cost estimate associated with the project be modified to reflect current City construction costs in effect at the time of request for an extension of time for the Public Improvement Agreement or issuance of a permit.

LD5. (G) The developer shall monitor, supervise and control all construction and construction supportive activities, so as to prevent these activities from causing a public nuisance, including but not limited to, insuring strict adherence to the following:

(a) Removal of dirt, debris, or other construction material deposited on any public street no later than the end of each working day.

(b) Observance of working hours as stipulated on permits issued by the Public Works Department.

(c) The construction site shall accommodate the parking of all motor vehicles used by persons working at or providing deliveries to the site.

(d) All dust control measures per South Coast Air Quality Management District (SCAQMD) requirements shall be adhered to during the grading operations.

Violation of any condition or restriction or prohibition set forth in these conditions shall subject the owner, applicant, developer or contractor(s) to remedies as noted in the City Municipal Code 8.14.090. In addition, the City Engineer or Building Official may suspend all construction related activities for violation of any condition, restriction or prohibition set forth in these conditions until such time as it has been determined that all operations and activities are in conformance with these conditions.

LD6. (G) The developer shall protect downstream properties from damage caused by alteration of drainage patterns, i.e., concentration or diversion of flow. Protection shall be provided by constructing adequate drainage facilities, including, but not limited to, modifying existing facilities or by securing a drainage easement. (MC 9.14.110)

LD7. (G) A detailed drainage study shall be submitted to the City Engineer for review and approval at the time of any improvement or grading plan submittal. The study shall be prepared by a registered civil engineer and shall include existing and proposed hydrologic conditions. Hydraulic calculations are required for all drainage control devices and storm drain lines. (MC 9.14.110). Prior to approval of the related improvement or grading plans, the developer shall submit the approved drainage study, on compact disk, in (.pdf) digital format to the Land Development Division of the Public Works Department.

LD8. (G) Prior to occupancy, the developer shall enter into a Development Impact Fee (DIF) Improvement Credit Agreement to secure credit and reimbursement for the construction of applicable **Indian Street** improvements. If the developer fails to complete this agreement prior to the timing as specified above, no credits or reimbursements will be given. The applicant shall pay Arterial Streets, Traffic Signals, and Interchange Improvements development impact fees adopted by the City Council by resolution. (Ord. 695 § 1.1 (part), 2005) (MC 3.38.030, .040, .050)

LD9. (G) Prior to occupancy, the developer shall enter into a Transportation Uniform Mitigation Fee (TUMF) Improvement Credit Agreement to secure credit and reimbursement for the construction of applicable **Perris Boulevard** improvements. If the developer fails to complete this agreement by the timing as specified above, no credits or reimbursements will be given for any work. Prior to approval of the TUMF Improvement Credit Agreement, an approved engineer's cost estimate and street improvement plan are required.

LD10. (G) The final conditions of approval issued by the Planning Division subsequent to Planning Commission approval shall be photographically or electronically placed on

mylar sheets and included in the Grading and Street Improvement plan sets on twenty-four (24) inch by thirty-six (36) inch mylar and submitted with the plans for plan check. These conditions of approval shall become part of these plan sets and the approved plans shall be available in the field during grading and construction.

Prior to Grading Plan Approval or Grading Permit

LD11. (GPA) Prior to approval of the grading plans, plans shall be drawn on twenty-four (24) inch by thirty-six (36) inch mylar and signed by a registered civil engineer and other registered/licensed professional as required.

LD12. (GPA) Prior to approval of grading plans, the developer shall ensure compliance with the City Grading ordinance, these Conditions of Approval and the following criteria:

a. The project street and lot grading shall be designed in a manner that perpetuates the existing natural drainage patterns with respect to tributary drainage area and outlet points. Unless otherwise approved by the City Engineer, lot lines shall be located at the top of slopes.

b. Any grading that creates cut or fill slopes adjacent to the street shall provide erosion control, sight distance control, and slope easements as approved by the City Engineer.

c. A grading permit shall be obtained from the Public Works Department Land Development Division prior to commencement of any grading outside of the City maintained road right-of-way.

d. All improvement plans are substantially complete and appropriate clearance and at-risk letters are provided to the City. (MC 9.14.030)

e. The developer shall submit a soils and geologic report to the Public Works Department – Land Development Division. The report shall address the soil's stability and geological conditions of the site.

LD13. (GPA) Prior to grading plan approval, the developer shall select and implement treatment control best management practices (BMPs) that are medium to highly effective for treating Pollutants of Concern (POC) for the project. Projects where National Pollution Discharge Elimination System (NPDES) mandates water quality treatment control best management practices (BMPs) shall be designed per the City of Moreno Valley guidelines or as approved by the City Engineer.

LD14. (GPA) Prior to approval of the grading plans for projects that will result in discharges of storm water associated with construction with a soil disturbance of one or more acres of land, the developer shall submit a Notice of Intent (NOI) and obtain a Waste Discharger's Identification number (WDID#) from the State Water Quality Control

Board (SWQCB). The WDID# shall be noted on the grading plans prior to issuance of the first grading permit.

LD15. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall submit two (2) copies of the final project-specific Water Quality Management Plan (WQMP) for review by the City Engineer that :

a. Addresses Site Design Best Management Practices (BMPs) such as minimizing impervious areas, maximizing permeability, minimizes directly connected impervious areas to the City's street and storm drain systems, and conserves natural areas;
b. Incorporates Source Control BMPs and provides a detailed description of their implementation;
c. Incorporates Treatment Control BMPs and provides information regarding design considerations;
d. Describes the long-term operation and maintenance requirements for BMPs requiring maintenance; and
e. Describes the mechanism for funding the long-term operation and maintenance of the BMPs.

A copy of the final WQMP template can be obtained on the City's Website or by contacting the Land Development Division of the Public Works Department.

LD16. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall record a "Stormwater Treatment Device and Control Measure Access and Maintenance Covenant," to provide public notice of the requirement to implement the approved final project-specific WQMP and the maintenance requirements associated with the WQMP.

A boilerplate copy of the "Stormwater Treatment Device and Control Measure Access and Maintenance Covenant," can be obtained by contacting the Land Development Division of the Public Works Department

LD17. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall secure approval of the final project-specific WQMP from the City Engineer. The final project-specific WQMP shall be submitted at the same time of grading plan submittal. The approved final WQMP shall be submitted to the Storm Water Program Manager on compact disk(s) in Microsoft Word format prior to grading plan approval.

LD18. (GPA) Prior to the grading plan approval, or issuance of a building permit as determined by the City Engineer, the approved final project-specific WQMP shall be incorporated by reference or attached to the project's Storm Water Pollution Prevention Plan as the Post-Construction Management Plan.

LD19. (GPA) Prior to grading plan approval, the developer shall prepare a Storm Water Pollution Prevention Plan (SWPPP) in conformance with the state's Construction Activities Storm Water General Permit. A copy of the current SWPPP shall be kept at the project site and be available for review upon request. The SWPPP shall be submitted to the Storm Water Program Manager on compact disk(s) in Microsoft Word format.

LD20. (GPA) Prior to the approval of the grading plans, the developer shall pay applicable remaining grading plan check fees.

LD21. (GP) Prior to issuance of a grading permit, or building permit when a grading permit is not required, for projects that require a project-specific Water Quality Management Plan (WQMP), a project-specific final WQMP (F-WQMP) shall be approved. Upon approval, a WQMP Identification Number is issued by the Storm Water Management Section and shall be noted on the rough grading plans as confirmation that a project-specific F-WQMP approval has been obtained.

LD22. (GP) Prior to issuance of a grading permit, if the fee has not already been paid prior to map approval or prior to issuance of a building permit if a grading permit is not required, the developer shall pay Area Drainage Plan (ADP) fees. The developer shall provide a receipt to the City showing that ADP fees have been paid to Riverside County Flood Control and Water Conservation District. (MC 9.14.100)

LD23. (GP) Prior to issuance of a grading permit, security, in the form of a cash deposit (preferable), letter of credit, or performance bond shall be required to be submitted as a guarantee of the completion of the grading required as a condition of approval of the project.

LD24. (GP) Prior to issuance of a grading permit, the developer shall pay the applicable grading inspection fees.

<u>Prior to Map Approval or Recordation</u>

LD25. (MA) Prior to approval of the map, the developer shall submit a copy of the Covenants, Conditions and Restrictions (CC&Rs) to the Land Development Division for review and approval. The CC&Rs shall include, but not be limited to, access easements, reciprocal access, private and/or public utility easements as may be relevant to the project.

LD26. (MA) Prior to approval of the map, all street dedications shall be irrevocably offered to the public and shall continue in force until the City accepts or abandons such offers, unless otherwise approved by the City Engineer. All dedications shall be free of all encumbrances as approved by the City Engineer.

LD27. (MA) Prior to approval of the map, security shall be required to be submitted as a guarantee of the completion of the improvements required as a condition of approval of the project. A public improvement agreement will be required to be executed.

LD28. (MR) Prior to recordation of the map, the developer shall submit the map, on compact disks, in (.dxf) digital format to the Land Development Division of the Public Works Department.

Prior to Improvement Plan Approval or Construction Permit

LD29. (IPA) Prior to approval of the improvement plans, the improvement plans shall be drawn on twenty-four (24) inch by thirty-six (36) inch mylar and signed by a registered civil engineer and other registered/licensed professional as required.

LD30. (IPA) Prior to approval of the improvement plans, the developer shall submit clearances from all applicable agencies, and pay all outstanding plan check fees. (MC 9.14.210)

LD31. (IPA) All public improvement plans prepared and signed by a registered civil engineer in accordance with City standards, policies and requirements shall be approved by the City Engineer in order for the Public Improvement Agreement and accompanying security to be executed.

LD32. (IPA) Prior to approval of the improvement plans, securities and a public improvement agreement shall be required to be submitted and executed as a guarantee of the completion of the improvements required as a condition of approval of the project.

LD33. (IPA) The street improvement plans shall comply with all applicable City standards and the following design standards throughout this project:

a. Corner cutbacks in conformance with City Standard 208 shall be shown on the final map or, if no map is to be recorded, offered for dedication by separate instrument.

b. Lot access to major thoroughfares shall be restricted except at intersections and approved entrances and shall be so noted on the final map. (MC 9.14.100)

c. The minimum centerline and flow line grades shall be one percent unless otherwise approved by the City Engineer. (MC 9.14.020)

d. All street intersections shall be at ninety (90) degrees plus or minus five (5) degrees per City Standard No. 706A, or as approved by the City Engineer. (MC 9.14.020)

LD34. (IPA) Prior to approval of the improvement plans, the plans shall indicate any restrictions on trench repair pavement cuts to reflect the City's moratorium on disturbing newly-constructed pavement less than three years old and recently slurry sealed streets less than one year old. Pavement cuts for trench repairs may be

allowed for emergency repairs or as specifically approved in writing by the City Engineer.

LD35. (IPA) Prior to approval of the improvement plans, the developer is required to bring any existing access ramps adjacent to and fronting the project to current ADA (Americans with Disabilities Act) requirements. However, when work is required in an intersection that involves or impacts existing access ramps, those access ramps in that intersection shall be retrofitted to comply with current ADA requirements, unless approved otherwise by the City Engineer.

LD36. (IPA) Prior to approval of the improvement plans, drainage facilities with sump conditions shall be designed to convey the tributary 100-year storm flows. Secondary emergency escape shall also be provided. (MC 9.14.110)

LD37. (IPA) Prior to the approval of the improvement plans, the hydrology study shall show that the 10-year storm flow will be contained within the curb and the 100-year storm flow shall be contained within the street right-of-way. In addition, one lane in each direction shall not be used to carry surface flows during any storm event for street sections equal to or larger than a minor arterial. When any of these criteria is exceeded, additional drainage facilities shall be installed. (MC 9.14.110 A.2)

LD38. (IPA) The project shall be designed to accept and properly convey all off-site drainage flowing onto or through the site. All storm drain design and improvements shall be subject to review and approval of the City Engineer. In the event that the City Engineer permits the use of streets for drainage purposes, the provisions of the Development Code will apply. Should the quantities exceed the street capacity or the use of streets be prohibited for drainage purposes, as in the case where one travel lane in each direction shall not be used for drainage conveyance for emergency vehicle access on streets classified as minor arterials and greater, the developer shall provide adequate facilities as approved by the Public Works Department – Land Development Division. (MC 9.14.110)

LD39. (CP) All work performed within the City right-of-way requires a construction permit. As determined by the City Engineer, security may be required for work within the right-of-way. Security shall be in the form of a cash deposit or other approved means. The City Engineer may require the execution of a public improvement agreement as a condition of the issuance of the construction permit. All inspection fees shall be paid prior to issuance of construction permit. (MC 9.14.100)

LD40. (CP) Prior to issuance of a construction permit, all public improvement plans prepared and signed by a registered civil engineer in accordance with City standards, policies and requirements shall be approved by the City Engineer.

LD41. (CP) Prior to issuance of construction permits, the developer shall submit all improvement plans on compact disks, in (.dxf) digital format to the Land Development Division of the Public Works Department.

LD42. (CP) Prior to issuance of construction permits, the developer shall pay all applicable inspection fees.

Prior to Building Permit

LD43. (BP) Prior to issuance of a building permit, if the project involves a non-residential subdivision, the map shall be recorded.

LD44. (BP) Prior to issuance of a building permit (excluding model homes), an approval by the City Engineer is required of the water quality control basin(s). The developer shall provide certification to the line, grade, flow test and system invert elevations.

LD45. (BP) Prior to issuance of a building permit, all pads shall meet pad elevations per approved plans as noted by the setting of "Blue-top" markers installed by a registered land surveyor or licensed engineer.

LD46. (BP) Prior to issuance of a building permit, the developer shall submit for review and approval, a Waste Management Plan (WMP) that shows data of waste tonnage, supported by original or certified photocopies of receipts and weight tags or other records of measurement from recycling companies and/or landfill and disposal companies. The Waste Management Plan shall contain the following:

a. The estimated volume or weight of project waste to be generated by material type. Project waste or debris may consist of vegetative materials including trees, tree parts, shrubs, stumps, logs, brush, or any other type of plants that are cleared from a site. Project waste may also include roadwork removal, rocks, soils, concrete and other material that normally results from land clearing.
b. The maximum volume or weight of such materials that can be feasibly diverted via reuse and recycling.
c. The vendor(s) that the applicant proposes to use to haul the materials.
d. Facility(s) the materials will be hauled to, and their expected diversion rates.
e. Estimated volume or weight of clearing, grubbing, and grading debris that will be landfilled.

Approval of the WMP requires that at least fifty (50) percent of all clearing, grubbing, and grading debris generated by the project shall be diverted, unless the developer is granted an exemption. Exemptions for diversions of less than fifty (50) percent will be reviewed on a case by case basis. (AB939, MC 8.80)

Prior to Certificate of Occupancy

LD47. (CO) Prior to issuance of the last certificate of occupancy or building final, the developer shall pay all outstanding fees.

LD48. (CO) Prior to issuance of a certificate of occupancy, this project is subject to requirements under the current permit for storm water activities required as part of

the National Pollutant Discharge Elimination System **(NPDES)** as mandated by the Federal Clean Water Act. In compliance with Proposition 218, the developer shall agree to approve the City of Moreno Valley NPDES Regulatory Rate Schedule that is in place at the time of certificate of occupancy issuance. Following are the requirements:

a. Select one of the following options to meet the financial responsibility to provide storm water utilities services for the required continuous operation, maintenance, monitoring system evaluations and enhancements, remediation and/or replacement, all in accordance with Resolution No. 2002-46.
   i. Participate in the mail ballot proceeding in compliance with Proposition 218, for the Common Interest, Commercial, Industrial and Quasi-Public Use NPDES Regulatory Rate Schedule and pay all associated costs with the ballot process; or
   ii. Establish an endowment to cover future City costs as specified in the Common Interest, Commercial, Industrial and Quasi-Public Use NPDES Regulatory Rate Schedule.

b. Notify the Special Districts Division of the intent to request building permits 90 days prior to their issuance and the financial option selected. The financial option selected shall be in place prior to the issuance of certificate of occupancy. (California Government Code & Municipal Code)

LD49. (CO) The City of Moreno Valley has an adopted Development Impact Fee (DIF) nexus study. All projects unless otherwise exempted shall be subject to the payment of the DIF prior to issuance of occupancy. The fees are subject to the provisions of the enabling ordinance and the fee schedule in effect at the time of occupancy.

LD50. (CO) The City of Moreno Valley has an adopted area wide Transportation Uniform Mitigation Fee (TUMF). All projects unless otherwise exempted shall be subject to the payment of the TUMF prior to issuance of occupancy. The fees are subject to the provisions of the enabling ordinance and the fee schedule in effect at the time of occupancy.

LD51. (CO) Prior to issuance of a certificate of occupancy or building final, the developer shall construct all public improvements in conformance with applicable City standards, except as noted in the Special Conditions, including but not limited to the following applicable improvements:

a. Street improvements including, but not limited to: pavement, base, curb and/or gutter, cross gutters, spandrel, sidewalks, drive approaches, pedestrian ramps, street lights, signing, striping, under sidewalk drains, landscaping and irrigation, medians, redwood header boards, pavement tapers/transitions and traffic control devices as appropriate.

b. Storm drain facilities including, but not limited to: storm drain pipe, storm drain laterals, open channels, catch basins and local depressions.

c. City-owned utilities.

d. Sewer and water systems including, but not limited to: sanitary sewer, potable water and recycled water.

e. Under grounding of existing and proposed utility lines less than 115,000 volts.

f. Relocation of overhead electrical utility lines including, but not limited to: electrical, cable and telephone.

LD52. (CO) Prior to issuance of a certificate of occupancy or building final, all existing and new utilities adjacent to and on-site shall be placed underground in accordance with City of Moreno Valley ordinances. (MC 9.14.130)

LD53. (CO) Prior to issuance of a certificate of occupancy or building final for any Commercial/Industrial facility, whichever occurs first, the owner may have to secure coverage under the State's General Industrial Activities Storm Water Permit as issued by the State Water Resources Control Board.

SPECIAL CONDITIONS

LD54. Prior to parcel map approval, the map shall show the following:

a. A 4-foot minimum pedestrian right-of-way dedication behind any driveway approach per City Standard 118C, on Perris Boulevard, Indian Street, and Grove View Road.

b. A 2-foot public access easement for the portions of sidewalk which are outside of the public right-of-way, along Perris Boulevard and Indian Street.

c. The appropriate additional right-of-way required for a bus turn-out on Perris Boulevard as depicted on the approved project plans and as conditioned by the City's Transportation Department.

d. Corner cutback right-of-way dedications per City Standard 208 at the southeast corner of Indian Street and Grove View Road and the southwest corner of Perris Boulevard and Grove View Road.

LD55. Prior to parcel map approval, the Developer shall guarantee the construction of the following improvements by entering into a public improvement agreement and posting security. The improvements shall be completed prior to occupancy of the first building or as otherwise determined by the City Engineer.

a. Perris Boulevard, Divided Arterial, City Standard 103C (110-foot RW / 86-foot CC) shall be constructed to half-width plus an additional 18 feet east of the centerline, along the entire project's east frontage. Additional right-of-way dedications at driveway approaches as well as a 2-foot pedestrian access easement, along the project's west property line, shall be shown on the parcel map. Improvements shall consist of, but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, any necessary offsite improvement transition/joins to existing, streetlights, pedestrian ramps, removal/relocation and/or undergrounding of any power poles with overhead utility lines less than 115,000 volts, and dry and wet utilities.

b. Indian Street, Minor Arterial, Modified City Standard 105A (88-foot RW / 64-foot CC) shall be constructed to half-width plus an additional 18 feet west of the centerline, along the entire project's east frontage. Additional right-of-way dedications at driveway approaches as well as a 2-foot pedestrian access easement, along the project's west property line, shall be shown on the parcel map. Improvements shall consist of, but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, streetlights, pedestrian ramps, removal/relocation and/or undergrounding of any power poles with overhead utility lines less than 115,000 volts, and dry and wet utilities.

c. Grove View Road, Industrial Collector, City Standard 106 (78-foot RW / 56-foot CC) shall be constructed to half-width plus an additional 18 feet north of the centerline, along the entire project's north frontage. Additional right-of-way dedications at driveway approaches along the project's north property line, shall be shown on the parcel map.. Improvements shall consist of, but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, any necessary offsite, streetlights, pedestrian ramps, dry and wet utilities.

d. Driveway approaches shall be constructed per City Standard No. 118C or as modified as shown on the project plans. The parcel map shall show an additional 4-foot minimum right-of-way dedication behind driveway approaches. No decorative pavers shall be placed within the public right-of-way. Certain project entrance(s) may be required to be constructed as a public street intersection.

e. Pavement core samples of existing pavement may be taken and findings submitted to the City for review and consideration of pavement improvements. The City will determine the adequacy of the existing pavement structural section. If the existing pavement structural section is found to be adequate, the developer may still be required to perform a one-tenth inch grind and overlay or slurry seal depending on the severity of existing pavement cracking, as required by the City

Engineer. If the existing pavement section is found to be inadequate, the Developer shall replace the pavement to meet or exceed the City's pavement structural section standard.

LD56. Prior to precise grading plan or improvement plan approval, as applicable, the plans shall show all driveway approaches to be constructed per City Standard Plan 118C modified, as accepted by the City. There shall be 4-foot minimum wide pedestrian sidewalk area at 2% maximum behind the conventional right-of-way. A minimum 4-foot pedestrian right-of-way dedication shall be made on the final parcel map PM 35672.

LD57. Prior to precise grading plan approval, the grading plan shall show any proposed trash enclosure as dual bin; one bin for trash and one bin for recyclables. The trash enclosure shall be per City Standard Plan 627.

LD58. Prior to precise grading plan approval, the grading plan shall show that the lowest finished floor elevation is a minimum of one foot above the base flood elevation.

LD59. Prior to precise grading plan approval, the grading plans shall clearly show that the parking lot conforms to City standards. The parking lot shall be 5% maximum, 1% minimum, 2% maximum at or near any disabled parking stall and travel way. Ramps, curb openings and travel paths shall all conform to current ADA standards as outlined in Department of Justice's "ADA Standards for Accessible Design", Excerpt from 28 CFR Part 36. (www.usdoj.gov) and as approved by the City's Building and Safety Division.

LD60. Prior to occupancy, the developer shall obtain an encroachment permit from Riverside County Flood Control & Water Conservation District in order to connect proposed onsite storm drain to the Perris Valley Channel Lateral B.

LD61. Prior to occupancy, the developer shall make a good faith effort to cause Riverside County Flood Control & Water Conservation District to dedicate additional public street right-of-way on Indian Street and Perris Boulevard along their property frontage between the project's south property line and the bridges.

LD62. Prior to occupancy, all overhead utility lines less than 115,000 volts fronting or within the entire project site boundary shall be placed underground per Section 9.14.130C of the City Municipal Code.

LD63. The Applicant shall select and implement treatment control BMPs that are medium to highly effective for treating Pollutants of Concern (POC) for the project. POC include project pollutants associated with a 303(d) listing or a Total Maximum Daily Load (TMDL) for receiving waters. Project POC include sediment/turbidity, nutrients, oxygen demanding substances, and pathogens

(bacteria and viruses). Exhibit C of the document, "Riverside County Water Quality Management Plan for Urban Runoff" dated July 24, 2006 shall be consulted for determining the effectiveness of proposed treatment BMPs.

LD64. Overall, the proposed treatment control concept is accepted as the conceptual treatment control BMP for the proposed site.

LD65. The Applicant has proposed to incorporate the use of vegetated swales, hydrodynamic separators, and sand filters. Final design details of the treatment control BMPs must be provided in the first submittal of the F-WQMP. The size of the treatment control BMPs is to be determined using the procedures set forth in Exhibit C of the Riverside County Guidance Document. The Applicant acknowledges that more area than currently shown on the plans may be required to treat site runoff as required by the WQMP guidance.

LD66. The Applicant shall substantiate the applicable Hydrologic Condition of Concern (HCOC) (WQMP Section IV) in the F-WQMP. The HCOC designates that the project will comply with Condition A; therefore, the condition must be addressed in the F-WQMP.

LD67. The Applicant shall, prior to building or grading permit closeout or the issuance of a certificate of occupancy, demonstrate:

a. That all structural BMPs have been constructed and installed in conformance with the approved plans and specifications;

b. That all structural BMPs described in the F-WQMP have been implemented in accordance with approved plans and specifications;

c. That the Applicant is prepared to implement all non-structural BMPs included in the F-WQMP, conditions of approval, and building/grading permit conditions; and

d. That an adequate number of copies of the approved F-WQMP are available for the future owners/occupants of the project.

PUBLIC WORKS DEPARTMENT – SPECIAL DISTRICTS DIVISION

Note: All Special Conditions, Modified Conditions, or Clarification of Conditions are in bold lettering. All other conditions are standard to all or most development projects.

Acknowledgement of Conditions

The following items are Special Districts' Conditions of Approval for project **PA09-0004**; this project shall be completed at no cost to any Government Agency. All questions regarding Special Districts' Conditions including but not limited to, intent, requests for change/modification, variance and/or request for extension of time shall be sought from the Special Districts Division of the Public Works Department 951.413.3480. The applicant is fully responsible for communicating with each designated Special Districts staff member regarding their conditions.

General Conditions

SD1. The parcel(s) associated with this project have been incorporated into the Moreno Valley Community Services Districts Zones A (Parks & Community Services) and C (Arterial Street Lighting). All assessable parcels therein shall be subject to annual Zone A and Zone C charges for operations and capital improvements.

SD2. Plans for parkway, median, slope, and/or open space landscape areas designated on the tentative map or in these Conditions of Approval for incorporation into Moreno Valley Community Services District **Zone M**, shall be prepared and submitted in accordance with the *City of Moreno Valley Public Works Department Landscape Design Guidelines*. Contact the Special Districts Division of the Public Works Department to obtain copies of this document.

SD3. The developer, or the developer's successors or assignees shall be responsible for all parkway and/ or median landscaping maintenance until such time as the District accepts maintenance duties.

SD4. Any damage to existing landscape easement areas due to project construction shall be repaired/replaced by the developer, or developer's successors in interest, at no cost to the Moreno Valley Community Services District.

Prior to Building Permit Issuance

SD5. (BP) This project has been identified to be included in the formation of a Community Facilities District (Mello-Roos) for **Public Safety** services, including but not limited to Police, Fire Protection, Paramedic Services, Park Rangers, and Animal Control services. The property owner(s) shall not protest the formation; however, they retain the right to object to the rate and method of maximum special tax. In compliance with Proposition 218, the developer shall agree to approve the mail ballot proceeding (special election) for either formation of the CFD or annexation into an existing district that may already be established. The Developer must notify Special

Districts of intent to request building permits 90 days prior to their issuance. (California Government Code)

SD6. (BP) This project is conditioned to provide a funding source for the capital improvements and/or maintenance for the **Perris Blvd.** median landscape. In order for the Developer to meet the financial responsibility to maintain the defined service, one of the following options shall be selected:

a. Participate in the mail ballot proceeding in compliance with Proposition 218, for Moreno Valley Community Services District **Zone M** (Commercial, Industrial and Multifamily Improved Median Maintenance), and pay all associated costs with the ballot process; or

b. Establish an endowment to cover the future maintenance costs of the landscaped area.

The developer must notify Special Districts of intent to request building permits 90 days prior to their issuance and the financial option selected to fund the continued maintenance.

SD7. *Commercial* (BP) If Land Development, a Division of the Public Works Department, requires this project to supply a funding source necessary to provide, but not limited to, stormwater utilities services for the monitoring of on site facilities and performing annual inspections of the affected areas to ensure compliance with state mandated stormwater regulations, the developer must notify Special Districts 90 days prior to the City's issuance of a building permit and the financial option selected to fund the continued maintenance. (California Government Code)

SD8. (BP) Prior to release of building permit, the developer, or the developer's successors or assignees, shall record with the County Recorder's Office a **Declaration of Covenant and Acknowledgement of Assessments** for each assessable parcel therein, whereby the developer covenants and acknowledges the existence of the Moreno Valley Community Services District, its established benefit zones, and that said parcel(s) is (are) liable for payment of annual benefit zone charges and the appropriate National Pollutant Discharge Elimination System (NPDES) maximum regulatory rate schedule when due. A copy of the recorded Declaration of Covenant and Acknowledgement of Assessments shall be submitted to the Special Districts Division.

**For a copy of the Declaration of Covenant and Acknowledgement of the Assessments form, please contact Special Districts, phone 951.413.3480.

SD9. (BP) Final median, parkway, slope, and/or open space landscape/irrigation plans for those areas designated on the tentative map or in these Conditions of Approval for inclusion into Community Services District shall be reviewed and approved by the Community Development Department–Planning Division, and the Public Works

Department–Special Districts and Transportation Divisions prior to the issuance of the first Building Permit.

Prior to Certificate of Occupancy

SD10. (CO) Prior to issuance of a Certificate of Occupancy or building final, the developer shall submit a letter to Special Districts from the Utility service responsible for providing final electrical energy connections and energization of the streetlights for the development project. The letter must identify, by pole number, each streetlight in the development and state the corresponding date of its electrical energization.

SD11. (CO) All parkway and/or median landscaping specified in the tentative map or in these Conditions of Approval shall be constructed prior to the issuance of the Certificate of Occupancy/Building Final for this project.

SD12. (CO) Prior to the issuance of the first Certificate of Occupancy or building final for this project, the developer shall pay Advanced Energy fees for all applicable Zone B (Residential Street Lighting) and/or Zone C (Arterial Street Lighting and Intersection Lighting) streetlights required for this development. The developer shall provide a receipt to the Special Districts Division showing that the Advanced Energy fees have been paid in full for the number of streetlights to be accepted into the CSD Zone B and/or Zone C program. Payment shall be made to the City of Moreno Valley, as collected by the Land Development Division, based upon the Advanced Energy fee rate at the time of payment and as set forth in the current Listing of City Fees, Charges and Rates, as adopted by City Council. Any change in the project which may increase the number of streetlights to be installed will require payment of additional Advanced Energy fees at the then current fee.

PUBLIC WORKS DEPARTMENT – TRANSPORTATION ENGINEERING DIVISION

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects.

Based on the information contained in our standard review process we recommend the following conditions of approval be placed on this project:

GENERAL CONDITIONS

TE1. Conditions of approval may be modified if project is phased or altered from any approved plans.

TE2. Perris Boulevard is classified as a Divided Arterial (110'RW/86'CC) per City Standard Plan No. 103C. The sidewalk shall be curb-separated. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

TE3. Indian Street is designated as a Minor Arterial (88'RW/64'CC) per City Standard Plan No. 105A. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

TE4. Grove View Road is designated as an Industrial Collector (78'RW/56'CC) per City Standard Plan No. 106. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

PRIOR TO GRADING PERMIT

TE5. (GP) Prior to issuance of a grading permit, the project applicant shall submit conceptual striping plans for improvements identified in condition TE11 as well as Indian Street for the City Traffic Engineer's approval.

PRIOR TO IMPROVEMENT PLAN APPROVAL OR CONSTRUCTION PERMIT

TE6. The driveways less than 40 feet in width shall conform to Section 9.16.250, and Table 9.16.250A of the City's Development Code - Design Guidelines, and City Standard Plan No. 118C. Driveways wider than 40' shall be designed as intersections with pedestrian access ramps per City standards.

TE7. Sight distance at driveways and on streets shall conform to City of Moreno Valley Standard No. 125A, B, C at the time of preparation of final grading, landscape, and street improvements.

TE8. Prior to the final approval of the street improvement plans, a signing and striping plan shall be prepared per City of Moreno Valley Standard Plans - Section 4 for all streets with a cross section of 66'/44' and wider.

TE9. Prior to issuance of a construction permit, construction traffic control plans prepared by a qualified, Registered Civil or Traffic engineer may be required.

TE10. Prior to the final approval of the street improvement plans, the project applicant shall design Perris Boulevard to include a bus bay per City Standard Plan No. 121 in the southbound direction, south of Grove View Road. The bus bay may be designed to serve as a combination right turn lane/bus bay to the satisfaction of the City Engineer.

TE11. Prior to the final approval of the street improvement plans, the project applicant shall design the intersection/traffic signal at Perris Boulevard and the South Project Driveway to provide the following (at a minimum):

Northbound: One left turn lane, one shared through/right turn lane
Southbound: One left turn lane, one through lane, one right turn lane
Eastbound: One left turn lane, one shared through/right turn lane
Westbound: One left turn lane, one shared through/right turn lane

NOTE: The curb return radii on the northwest/southwest corners shall be 50 feet.

TE12. Prior to the final approval of the street improvement plans, the project applicant shall design and modify the intersection of Perris Boulevard at Grove View Road to include a 200' northbound left turn lane with raised median. This modification may include relocation of the traffic detector loops and other traffic signal modifications.

PRIOR TO BUILDING PERMIT

TE13. (BP) Prior to issuance of a building permit, traffic signal plans shall be prepared by a registered civil or electrical engineer and shall be submitted to the City Traffic Engineer for the following intersections:

- **Perris Boulevard at South Project Driveway (signal modifications).**
- **Perris Boulevard at Grove View Road (signal modifications).**

TE14. (BP) Prior to issuance of a building permit, the project applicant shall make a fair-share contribution in the amount of $45,150 to the City of Moreno Valley for the construction of a traffic signal at Perris Boulevard and Suburban Lane. As this traffic signal is not in any existing fee program, payment of DIF and/or TUMF are not considered satisfaction of this obligation.

PRIOR TO CERTIFICATE OF OCCUPANCY OR BUILDING FINAL

TE15. (CO) Prior to issuance of a certificate of occupancy, all approved signing and striping shall be installed per current City Standards and the approved plans.

TE16. (CO) Each gated entrance shall be provided with the following, or as approved by the City Traffic Engineer:

a) A storage lane with a minimum of 75 feet queuing length for entering traffic.
b) Appropriate signing and striping.

All of these features must be kept in working order.

TE17. (CO) Prior to the issuance of a certificate of occupancy, the project applicant shall construct the traffic signal modifications identified in TE13. Construction shall be completed per the approved plans and coordinated with the street improvements.

TE18. (CO) Prior to issuance of a certificate of occupancy, the project applicant shall construct the intersection/roadway improvements identified in TE10, TE11, and TE12 per the approved plans.

TE19. (CO) Prior to the issuance of a certificate of occupancy for the project, driveway access at the following locations will be installed as follows:

- **North Perris Boulevard Driveway: Right-in, right-out access by means of a raised median.**
- **South Perris Boulevard Driveway: Full access by means of a traffic signal.**
- **Grove View Road Driveways: Full access.**
- **Indian Street Driveways: Full access.**

NOTE: All truck driveways shall have curb return radii of 50 feet.

PRIOR TO ACCEPTANCE OF STREETS INTO THE CITY-MAINTAINED ROAD SYSTEM

TE20. Prior to the acceptance of streets into the City-maintained road system, all approved traffic control and signing and striping shall be installed per current City Standards and the approved plans.

PUBLIC WORKS DEPARTMENT – MORENO VALLEY UTILITY

Note: All Special Conditions, Modified Conditions, or Clarification of Conditions are in bold lettering. All other conditions are standard to all or most development projects.

Acknowledgement of Conditions

The following items are Moreno Valley Utility's Conditions of Approval for project(s) PA09-0004 & PA09-0012; this project shall be completed at no cost to any Government Agency. All questions regarding Moreno Valley Utility's Conditions including but not limited to, intent, requests for change/modification, variance and/or request for extension of time shall be sought from Moreno Valley Utility (the Electric Utility Division) of the Public Works Department 951.413.3512. The applicant is fully responsible for communicating with Moreno Valley Utility staff regarding their conditions.

PRIOR TO RECORDATION OF FINAL MAP

MVU1. (R) For single family subdivisions, a three foot easement along each side yard property line shall be shown on the final map and offered for dedication to the City of Moreno Valley for public utility purposes, unless otherwise approved by the City Engineer. If the project is a multi-family development, townhome, condominium, apartment, commercial or industrial project, and it requires the installation of electric distribution facilities within common areas, a non-exclusive easement shall be provided to Moreno Valley Utility to include all such common areas. All easements shall include the rights of ingress and egress for the purpose of operation, maintenance, facility repair, and meter reading.

PRIOR TO ISSUANCE OF BUILDING PERMIT

MVU2. (BP) **City of Moreno Valley Municipal Utility Service – Electrical Distribution**: Prior to issuance of building permit, the developer shall submit a detailed engineering plan showing design, location and schematics for the utility system to be approved by the City Engineer. In accordance with Government Code Section 66462, the Developer **shall** execute an agreement with the City providing for the installation, construction, improvement and dedication of the utility system following recordation of final map and concurrent with trenching operations and other subdivision improvements so long as said agreement incorporates the approved engineering plan and provides financial security to guarantee completion and dedication of the utility system.

The Developer **shall** coordinate and receive approval from the City Engineer to install, construct, improve, and dedicate to the City, or the City's designee, all utility infrastructure (including but not limited to conduit, equipment, vaults, ducts, wires, switches, conductors, transformers, resistors, amplifiers, and "bring-up" facilities including electrical capacity to serve the identified development and other adjoining/abutting/ or benefiting projects as determined by Moreno Valley Utility) – collectively referred to as "utility system" (to and through the development), along with any appurtenant real property easements, as determined by the City Engineer to be necessary for the distribution and /or delivery of any and all "utility services" to each lot and unit within the Tentative Map. For purposes of this condition, "utility services" shall mean electric, cable television, telecommunication (including video, voice, and data) and other similar services designated by the City Engineer. "Utility services" shall not include sewer, water, and natural gas services, which are addressed by other conditions of approval. Properties within development will be subject to an electrical system capacity charge and that contribution will be collected prior to issuance of building permits.

The City, or the City's designee, shall utilize dedicated utility facilities to ensure safe, reliable, sustainable and cost effective delivery of utility services and maintain the integrity of streets and other public infrastructure. Developer shall, at developer's sole expense, install or cause the installation of such interconnection facilities as may be necessary to connect the electrical distribution infrastructure within the project to the Moreno Valley Utility owned and controlled electric distribution system. Alternatively, developer may cause the project to be included in or annexed to a community facilities district established or to be established by the City for the purpose of financing the installation of such interconnection and distribution facilities. The project shall be deemed to have been included in or annexed to such a community facilities district upon the expiration of the statute of limitations to any legal challenges to the levy of special taxes by such community facilities district within the property. The statute of limitations referred to above will expire 30 days after the date of the election by the qualified electors within the project to authorize the levy of special taxes and the issuance of bonds.

MVU3. This Project is **subject** to a Reimbursement Agreement. The Project is responsible for a proportionate share of costs associated with electrical distribution infrastructure previously installed that directly benefits the Project. The developer shall be responsible to pay to the City of Moreno Valley the sum of **$423,150.00** for this electrical distribution infrastructure prior to the issuance of building permits.

POLICE DEPARTMENT

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects

Standard Conditions

PD1. Prior to the start of any construction, temporary security fencing shall be erected. The fencing shall be a minimum of six (6) feet high with locking, gated access and shall remain through the duration of construction. Security fencing is required if there is: construction, unsecured structures, unenclosed storage of materials and/or equipment, and/or the condition of the site constitutes a public hazard as determined by the Public Works Department. If security fencing is required, it shall remain in place until the project is completed or the above conditions no longer exist. (MC 9.08.080)

PD2. (GP) Prior to the issuance of grading permits, a temporary project identification sign shall be erected on the site in a secure and visible manner. The sign shall be conspicuously posted at the site and remain in place until occupancy of the project. The sign shall include the following:

a. The name (if applicable) and address of the development.

b. The developer's name, address, and a 24-hour emergency telephone number. (MC 9.08.080)

PD3. (CO) Prior to the issuance of a Certificate of Occupancy, an Emergency Contact Information Form for the project shall be completed at the permit counter of the Community & Economic Development Department - Building Division for routing to the Police Department. (MC 9.08.080)

CITY OF MORENO VALLEY

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects.

COMMUNITY & ECONOMIC DEVELOPMENT DEPARTMENT

Planning Division

P1. Tentative Parcel Map No. 36162 is approved for the purposes of re-configuring the existing four parcels located within the project site and creating a single 80 acre parcel.

P2. Development within Tentative Parcel Map No. 36162 shall be under separate review and approval of a plot plan or a conditional use permit application(s) and shall be subject to the requirements of the City's Municipal Code.

P3. This project shall comply with the project mitigation measures listed in the conditions of approval for PA09-0004 and the mitigation monitoring program for the VIP Moreno Valley Project.

P4. This approval shall comply with all applicable requirements of the City of Moreno Valley Municipal Code.

EXHIBIT B

Timing Mechanisms for Conditions (see abbreviation at beginning of affected condition):

R - Map Recordation	GP - Grading Permits	CO - Certificate of Occupancy or building final
WP - Water Improvement Plans	BP - Building Permits	P - Any permit

Governing Document (see abbreviation at the end of the affected condition):

GP - General Plan	MC - Municipal Code	CEQA - California Environmental Quality Act
Ord - Ordinance	DG - Design Guidelines	Ldscp - Landscape Development Guidelines and Specs
Res - Resolution	UFC - Uniform Fire Code	UBC - Uniform Building Code
	SBM - Subdivision Map Act	

P5. This tentative map shall expire three years after the approval date of this tentative map unless extended as provided by the City of Moreno Valley Municipal Code; otherwise it shall become null and void and of no effect whatsoever in the event the applicant or any successor in interest fails to properly file a final map before the date of expiration. (MC 9.02.230, 9.14.050, 080)

P6. The site shall be developed in accordance with the approved tentative map on file in the Community & Economic Development Department -Planning Division, the Municipal Code regulations, General Plan, the Moreno Valley Industrial Area Plan and the conditions contained herein. (MC 9.14.020)

P7. All undeveloped portions of the site shall be maintained in a manner that provides for the control of weeds, erosion and dust. (MC 9.02.030)

P8. All landscaped areas shall be maintained in a healthy and thriving condition, free from weeds, trash and debris. (MC 9.02.030)

Prior to Issuance of Grading Permits

P9. (GP) Prior to issuance of grading permits, the developer shall pay the applicable Stephen's' Kangaroo Rat (SKR) Habitat Conservation Plan mitigation fee. (Ord)

P10. (GP) All site plans, grading plans, landscape and irrigation plans, fence/wall plans, lighting plans and street improvement plans shall be coordinated for consistency with this approval.

P11. (GP) If potential historic, archaeological, or paleontological resources are uncovered during excavation or construction activities at the project site, work in the affected area will cease immediately and a qualified person (meeting the Secretary of the Interior's standards (36CFR61)) shall be consulted by the applicant to evaluate the find, and as appropriate recommend alternative measures to avoid, minimize or mitigate negative effects on the historic, prehistoric, or paleontological resource. Determinations and recommendations by the consultant shall be implemented as deemed appropriate by the Community Development Director, in consultation with the State Historic Preservation Officer (SHPO) and any and all affected Native American Tribes before any further work commences in the affected area.

If human remains are discovered, work in the affected area shall cease immediately and the County Coroner shall be notified. If it is determined that the remains are potentially Native American, the California Native American Heritage Commission and any and all affected Native American Indians tribes such as the Morongo Band of Mission Indians or the Pechanga Band of Luiseno Indians shall be notified and appropriate measures provided by State law shall be implemented. (GP Objective 23.3, DG, CEQA).

P12. (GP) Prior to the issuance of grading permits, final erosion control landscape and irrigation plans for all cut or fill slopes over 3 feet in height shall be submitted to the Planning Division for review and approval for the phase in process. This shall include slopes associated with swales and basins. The plans shall be designed in accordance with the slope erosion plan as required by the City Engineer for that phase. Man-made slopes greater than 10 feet in height shall be "land formed" to conform to the natural terrain and shall be landscaped and stabilized to minimize visual scarring. Graded slopes shall have variations that do not exceed 2:1 (GP Objective 1.5, MC 9.08.080, DG)

P13. (GP) Prior to approval of any grading permits, any required final median enhancement/landscape/irrigation plans shall be submitted to the Community Development Department - Planning Division and Public Works Department – Special Districts for review and approval by each division. Timing of installation shall be determined by PW- Special Districts. (GP - Circulation Master Plan)

P14. (GP) Prior to the issuance of a precise grading permit, the plan shall show decorative treatments for all driveway ingress/egress locations of the project. Accessible pedestrian pathways interior to the site cannot be painted. If delineation is necessary, then an alternative material is required.

P15. (GP) Prior to the issuance of a precise grading permit, all required planter areas, curbs, including twelve-inch concrete step outs, and required parking space striping shall be shown on the precise grading plan.

P16. (GP) Prior to the issuance of any grading permits, the following burrowing owl survey requirements shall be incorporated into the grading plans in accordance with the Riverside County Multi-Species Habitat Conservation Plan: Within 30 days of and prior to disturbance, a burrowing owl pre-construction survey shall be conducted by a qualified biologist using accepted protocols. The survey shall be submitted to the Planning Division for review and approval.

<u>Prior to Recordation of Final Map</u>

P17. (R) Prior to final map recordation, subdivision phasing (including any proposed common open space or improvement phasing, if applicable), shall be subject to the Planning Division approval. Any proposed phasing shall provide for adequate vehicular access to all lots in each phase as determined by the City Transportation Engineer or designee and shall substantially conform to all intent and purpose of the subdivision approval. (MC 9.14.080)

Building and Safety Division

B1. The above project shall comply with the current California Codes (CBC, CEC, CMC and the CPC) as well as all other city ordinances. All new projects shall provide a soils report. Plans shall be submitted to the Building Department as a separate submittal.

COMMERCIAL, INDUSTRIAL, MULTI-FAMILY PROJECTS INCLUDING CONDOMINIUMS, TOWNHOMES, DUPLEXES AND TRIPLEX BUILDINGS REQUIRE THE FOLLOWING:

Prior to final inspection, all plans will be placed on a CD Rom for reference and verification. Plans will include "as built" plans, revisions and changes. The CD will also include Title 24 energy calculations, structural calculations and all other pertinent information. It will be the responsibility of the developer and or the building or property owner(s) to bear all costs required for this process. The CD will be presented to the Building Department for review prior to final inspection and building occupancy. The CD will become the property of the Moreno Valley Building Department at that time. In addition, a site plan showing the path of travel from public right of way and building to building access with elevations will be required.

B2. (BP) Prior to the issuance of a building permit, the applicant shall submit a properly completed "Waste Management Plan" (WMP), as required, to the Compliance Official (Building Official) as a portion of the building or demolition permit process.

FIRE PREVENTION BUREAU

1. **Please complete and return attached fire flow letter.**
2. The following Standard Conditions shall apply.

With respect to the conditions of approval, the following fire protection measures shall be provided in accordance with Moreno Valley City Ordinances and/or recognized fire protection standards:

F1. Final fire and life safety conditions will be addressed when the Fire Prevention Bureau reviews building plans. These conditions will be based on occupancy, use, California Building Code (CBC), California Fire Code (CFC), and related codes, which are in force at the time of building plan submittal.

F2. The Fire Prevention Bureau is required to set a minimum fire flow for the remodel or construction of all commercial buildings per CFC Appendix B and Table B105.1. The applicant/developer shall provide documentation to show there exists a water system capable of delivering 4000 GPM for 4 hour(s) duration at 20-PSI residual operating pressure. The required fire flow may be adjusted during the approval process to reflect changes in design, construction type, or automatic fire protection measures as approved by the Fire Prevention Bureau. Specific requirements for the project will be determined at time of submittal. (CFC 508.3, Appendix B and MVMC 8.36.100 Section D) **The 50% reduction in fire flow was granted for the use of fire sprinklers throughout the facility. The reduction shall only apply to fire flow, hydrant spacing shall be per the fire flow requirements listed in CFC Appendix B and C.**

F3. Industrial, Commercial, Multi-family, Apartment, Condominium, Townhouse or Mobile Home Parks. A combination of on-site and off-site super enhanced fire hydrants (6" x 4" x 4" x 2 ½") shall not be closer than 40 feet and more than 150 feet from any portion of the building as measured along approved emergency vehicular travel ways. The required fire flow shall be available from any adjacent fire hydrant(s) in the system. Where new water mains are extended along streets where hydrants are not needed for protection of structures or similar fire problems, super or enhanced fire hydrants as determined by the fire code official shall be provided at spacing not to exceed 500 feet of frontage for transportation hazards. (CFC 508.5.7 & MVMC 8.36.050 Section O and 8.36.100 Section E)

F4. During phased construction, dead end roadways and streets which have not been completed shall have a turn-around capable of accommodating fire apparatus. (CFC 503.1 and 503.2.5)

F5. Prior to issuance of Building Permits, the applicant/developer shall provide the Fire Prevention Bureau with an approved site plan for Fire Lanes and signage. (MVMC 8.36.050 and CFC 501.3)

F6. Prior to construction and issuance of building permits, all locations where structures are to be built shall have an approved Fire Department emergency vehicular access road (all weather surface) capable of sustaining an imposed load of 80,000 lbs. GVW, based on street standards approved by the Public Works Director and the Fire Prevention Bureau. (CFC 501.4 and MVMC 8.36.050 Section A)

F7. Prior to construction and issuance of Building Permits, fire lanes and fire apparatus access roads shall have an unobstructed width of not less than twenty–four (24) or thirty (30) feet as approved by the Fire Prevention Bureau and an unobstructed vertical clearance of not less the thirteen (13) feet six (6) inches. (CFC 503.2.1.1 and MVMC 8.36.050)

F8. Prior to construction, all roads, driveways and private roads shall not exceed 12 percent grade. (CFC 503.2.7 and MVMC 8.36.050)

F9. If construction is phased, each phase shall provide an approved emergency vehicular access way for fire protection prior to any building construction. (CFC 501.4 and MVMC 8.36.050 Section A)

F10. Prior to construction, all locations where structures are to be built shall have an approved Fire Department access based on street standards approved by the Public Works Director and the Fire Prevention Bureau. (CFC 501.3 and MVMC 8.36.050)

F11. Prior to building construction, dead end roadways and streets which have not been completed shall have a turnaround capable of accommodating fire apparatus. (CFC 503.2.5 and MVMC 8.36.050)

F12. Prior to issuance of Building Permits, the applicant/developer shall participate in the Fire Impact Mitigation Program. (Fee Resolution as adopted by City Council)

F13. Prior to issuance of Building Permits, the applicant/developer shall furnish one copy of the water system plans to the Fire Prevention Bureau for review. Plans shall:

a) Be signed by a registered civil engineer or a certified fire protection engineer;
b) Contain a Fire Prevention Bureau approval signature block; and
c) Conform to hydrant type, location, spacing of new and existing hydrants and minimum fire flow required as determined by the Fire Prevention Bureau.

After the local water company signs the plans, the originals shall be presented to the Fire Prevention Bureau for signatures. The required water system, including fire hydrants, shall be installed, made serviceable, and be accepted by the Moreno Valley Fire Department prior to beginning construction. They shall be maintained accessible.

Existing fire hydrants on public streets are allowed to be considered available. Existing fire hydrants on adjacent properties shall not be considered available unless fire apparatus access roads extend between properties and easements are established to prevent obstruction of such roads. (CFC 508.1 and MVMC 8.36.100)

F14. Prior to issuance of Certificate of Occupancy or Building Final, "Blue Reflective Markers" shall be installed to identify fire hydrant locations in accordance with City specifications. (CFC 510.1)

F15. Prior to issuance of Certificate of Occupancy or Building Final, all commercial buildings shall display street numbers in a prominent location on the street side and rear access locations. The numerals shall be a minimum of twelve (12) inches in height for buildings and six (6) inches in height for suite identification on a contrasting background. Unobstructed lighting of the address(s) shall be by means approved by the Fire Prevention Bureau and Police Department. In multiple suite centers (strip malls), businesses shall post the name of the business on the rear door(s). (CFC 505.1)

F16. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer shall install a fire sprinkler system based on square footage and type of construction, occupancy or use. Fire sprinkler plans shall be submitted to the Fire Prevention Bureau for approval prior to installation. (CFC Chapter 9)

F17. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer shall install a fire alarm system monitored by an approved Underwriters Laboratory listed central station based on a requirement for monitoring the sprinkler system, occupancy or use. Fire alarm panel shall be accessible from exterior of building in an approved location. Plans shall be submitted to the Fire Prevention Bureau for approval prior to installation. (CFC Chapter 9 and MVMC 8.36.070)

F18. Prior to issuance of a Certificate of Occupancy or Building Final, a "Knox Box Rapid Entry System" shall be provided. The Knox-Box shall be installed in an accessible location approved by the Fire Chief. The Knox-Box shall be supervised by the alarm system and all exterior security emergency access gates shall be electronically operated and be provided with Knox key switches for access by emergency personnel. (CFC 506.1)

F19. Prior to issuance of Certificate of Occupancy, approval shall be required from the County of Riverside Community Health Agency (Department of Environmental Health) and Moreno Valley Fire Prevention Bureau to maintain, store, use, handle materials, or conduct processes which produce conditions hazardous to life or property, and to install equipment used in connection with such activities. (CFC 2701.5)

F20. Prior to issuance of Certificate of Occupancy or Building Final, the applicant/developer must submit a simple plot plan, a simple floor plan, and other plans as requested, each as an electronic file in .dwg format, to the Fire Prevention Bureau. Alternate file formats may be acceptable with approval by the Fire Chief.

F21. The angle of approach and departure for any means of Fire Department access shall not exceed 1 ft drop in 20 ft (0.3 m drop in 6 m), and the design limitations of the fire apparatus of the Fire Department shall be subject to approval by the AHJ. (CFC 503.2.7 and MVMC 8.36.050 Section I)

F22. Prior to issuance of the building permit for development, independent paved access to the nearest paved road, maintained by the City shall be designed and constructed by the developer within the public right of way in accordance with City Standards. (MVMC 8.36.050)

F23. Prior to construction, "private" driveways over 150 feet in length shall have a turn-around as determined by the Fire Prevention Bureau capable of accommodating fire apparatus. Driveway grades shall not exceed 12 percent. (CFC 503 and MVMC 8.36.050)

F24. Complete plans and specifications for fire alarm systems, fire-extinguishing systems (including automatic sprinklers or standpipe systems), clean agent systems (or other special types of automatic fire-extinguishing systems), as well as other fire-protection systems and appurtenances thereto shall be submitted to the Moreno Valley Fire Prevention Bureau for review and approval prior to system installation. Submittals shall be in accordance with CFC Chapter 9 and associated accepted national standards.

F25. A permit is required to maintain, store, use or handle materials, or to conduct processes which produce conditions hazardous to life or property, or to install equipment used in connection with such activities. Such permits shall not be construed as authority to violate, cancel or set aside any of the provisions of this code. Such permit shall not take the place of any license required by law. Applications for permits shall be made to the Fire Prevention Bureau in such form and detail as prescribed by the Bureau. Applications for permits shall be accompanied by such plans as required by the Bureau. Permits shall be kept on the premises designated therein at all times and shall be posted in a conspicuous location on the premises or shall be kept on the premises in a location designated by

the Fire Chief. Permits shall be subject to inspection at all times by an officer of the fire department or other persons authorized by the Fire Chief in accordance with Appendix Chapter 1 and MVMC 8.36.100.

F26. Approval of the safety precautions required for buildings being constructed, altered or demolished shall be required by the Fire Chief in addition to other approvals required for specific operations or processes associated with such construction, alteration or demolition. (CFC Chapter 14 & CBC Chapter 33)

F27. Prior to issuance of Certificate of Occupancy, permits are required to store, dispense, use or handle hazardous material. Each application for a permit shall include a hazardous materials management plan (HMMP). The location of the HMMP shall be posted adjacent to (other) permits when an HMMP is provided. The HMMP shall include a facility site plan designating the following:

a) Storage and use areas;
b) Maximum amount of each material stored or used in each area;
c) Range of container sizes;
d) Locations of emergency isolation and mitigation valves and devises;
e) Product conveying piping containing liquids or gases, other than utility-owned fuel gas lines and low-pressure fuel gas lines;
f) On and off positions of valves for valves which are of the self-indicating type;
g) Storage plan showing the intended storage arrangement, including the location and dimensions of aisles. The plans shall be legible and approximately to scale. Separate distribution systems are allowed to be shown on separate pages; and
h) Site plan showing all adjacent/neighboring structures and use.

NOTE: Each application for a permit shall include a hazardous materials inventory statement (HMIS).

F28. Before a Hazardous Materials permit is issued, the Fire Chief shall inspect and approve the receptacles, vehicles, buildings, devices, premises, storage spaces or areas to be used. In instances where laws or regulations are enforceable by departments other than the Fire Prevention Bureau, joint approval shall be obtained from all departments concerned. (CFC Appendix H)

F29. Construction or work for which the Fire Prevention Bureau's approval is required shall be subject to inspection by the Fire Chief and such construction or work shall remain accessible and exposed for inspection purposes until approved. (CFC Section 106)

F30. The Fire Prevention Bureau shall maintain the authority to inspect, as often as necessary, buildings and premises, including such other hazards or appliances designated by the Fire Chief for the purpose of ascertaining and causing to be corrected any conditions which would reasonably tend to cause fire or contribute to its spread, or any violation of the purpose or provisions of this code and of any other law or standard affecting fire safety. (CFC Section 106)

F31. Permit requirements issued, which designate specific occupancy requirements for a particular dwelling, occupancy, or use, shall remain in effect until such time as amended by the Fire Chief. (CFC Section 104)

F32. In accordance with the California Fire Code Appendix Chapter 1, where no applicable standards or requirements are set forth in this code, or contained within other laws, codes, regulations, ordinances or bylaws adopted by the jurisdiction, compliance with applicable standards of the National Fire Protection Association or other nationally recognized fire safety standards as are approved shall be deemed as prima facie evidence of compliance with the intent of this code as approved by the Fire Chief. (CFC Section 102.7)

F33. Any alterations, demolitions, or change in design, occupancy and use of buildings or site will require plan submittal to the Fire Prevention Bureau with review and approval prior to installation. (CFC Appendix Chapter 1)

F34. Emergency and Fire Protection Plans shall be provided when required by the Fire Prevention Bureau. (CFC Section 105)

F35. Prior to construction, all traffic calming designs/devices must be approved by the Fire Marshal and City Engineer.

FIRE FLOW LETTER

Date: 02/24/2009 **Address:**

Case Number: PA09-0004 **A.P.N.:** 316-210-071, 073, 075, 076

This is certification the water system is capable of meeting the following required fire flows as determined by the California Fire Code Appendix B.

Based on the information provided on the above referenced case. The fire flow required for this project will be 4000 G.P.M. for duration of 4-HOURS measured at 20-psi residual pressure.

The required fire flow may be adjusted during the approval process to reflect changes in design, construction type or automatic fire protection measures as approved by the Fire Prevention Bureau.

COMMUNITY & ECONOMIC DEVELOPMENT DEPARTMENT – LAND DEVELOPMENT DIVISION

The following are the Land Development Division Conditions of Approval for this project and shall be completed at no cost to any government agency. All questions regarding the intent of the following conditions shall be referred to the Land Development Division.

General Conditions

LD1. (G) The developer shall comply with all applicable City ordinances and resolutions including the City's Municipal Code (MC) and if subdividing land, the Government Code (GC) of the State of California, specifically Sections 66410 through 66499.58, said sections also referred to as the Subdivision Map Act (SMA). (MC 9.14.010)

LD2. (G) It is understood that the tentative map correctly shows all existing easements, traveled ways, and drainage courses, and that their omission may require the map or plans associated with this application to be resubmitted for further consideration. (MC 9.14.040)

LD3. (G) In the event right-of-way or offsite easements are required to construct offsite improvements necessary for the orderly development of the surrounding area to meet the public health and safety needs, the developer shall make a good faith effort to acquire the needed right-of-way in accordance with the Land Development Division's administrative policy. In the event that the developer is unsuccessful, he shall enter into an agreement with the City to acquire the necessary right-of-way or offsite easements and complete the improvements at such time the City acquires the right-of-way or offsite easements which will permit the improvements to be made. The developer shall be responsible for all costs associated with the right-of-way or easement acquisition. (GC 66462.5)

LD4. (G) If improvements associated with this project are not initiated within two years of the date of approval of the Public Improvement Agreement, the City Engineer may require that the improvement cost estimate associated with the project be modified to reflect current City construction costs in effect at the time of request for an extension of time for the Public Improvement Agreement or issuance of a permit.

LD5. (G) The developer shall monitor, supervise and control all construction and construction supportive activities, so as to prevent these activities from causing a public nuisance, including but not limited to, insuring strict adherence to the following:

(a) Removal of dirt, debris, or other construction material deposited on any public street no later than the end of each working day.

(b) Observance of working hours as stipulated on permits issued by the Public Works Department.
(c) The construction site shall accommodate the parking of all motor vehicles used by persons working at or providing deliveries to the site.
(d) All dust control measures per South Coast Air Quality Management District (SCAQMD) requirements shall be adhered to during the grading operations.

Violation of any condition or restriction or prohibition set forth in these conditions shall subject the owner, applicant, developer or contractor(s) to remedies as noted in the City Municipal Code 8.14.090. In addition, the City Engineer or Building Official may suspend all construction related activities for violation of any condition, restriction or prohibition set forth in these conditions until such time as it has been determined that all operations and activities are in conformance with these conditions.

LD6. (G) The developer shall protect downstream properties from damage caused by alteration of drainage patterns, i.e., concentration or diversion of flow. Protection shall be provided by constructing adequate drainage facilities, including, but not limited to, modifying existing facilities or by securing a drainage easement. (MC 9.14.110)

LD7. (G) A detailed drainage study shall be submitted to the City Engineer for review and approval at the time of any improvement or grading plan submittal. The study shall be prepared by a registered civil engineer and shall include existing and proposed hydrologic conditions. Hydraulic calculations are required for all drainage control devices and storm drain lines. (MC 9.14.110). Prior to approval of the related improvement or grading plans, the developer shall submit the approved drainage study, on compact disk, in (.pdf) digital format to the Land Development Division of the Public Works Department.

LD8. (G) Prior to occupancy, the developer shall enter into a Development Impact Fee (DIF) Improvement Credit Agreement to secure credit and reimbursement for the construction of applicable **Indian Street** improvements. If the developer fails to complete this agreement prior to the timing as specified above, no credits or reimbursements will be given. The applicant shall pay Arterial Streets, Traffic Signals, and Interchange Improvements development impact fees adopted by the City Council by resolution. (Ord. 695 § 1.1 (part), 2005) (MC 3.38.030, .040, .050)

LD9. (G) Prior to occupancy, the developer shall enter into a Transportation Uniform Mitigation Fee (TUMF) Improvement Credit Agreement to secure credit and reimbursement for the construction of applicable **Perris Boulevard** improvements. If the developer fails to complete this agreement by the timing as specified above, no credits or reimbursements will be given for any work. Prior to approval of the

TUMF Improvement Credit Agreement, an approved engineer's cost estimate and street improvement plan are required.

LD10. (G) The final conditions of approval issued by the Planning Division subsequent to Planning Commission approval shall be photographically or electronically placed on mylar sheets and included in the Grading and Street Improvement plan sets on twenty-four (24) inch by thirty-six (36) inch mylar and submitted with the plans for plan check. These conditions of approval shall become part of these plan sets and the approved plans shall be available in the field during grading and construction.

Prior to Grading Plan Approval or Grading Permit

LD11. (GPA) Prior to approval of the grading plans, plans shall be drawn on twenty-four (24) inch by thirty-six (36) inch mylar and signed by a registered civil engineer and other registered/licensed professional as required.

LD12. (GPA) Prior to approval of grading plans, the developer shall ensure compliance with the City Grading ordinance, these Conditions of Approval and the following criteria:

a. The project street and lot grading shall be designed in a manner that perpetuates the existing natural drainage patterns with respect to tributary drainage area and outlet points. Unless otherwise approved by the City Engineer, lot lines shall be located at the top of slopes.

b. Any grading that creates cut or fill slopes adjacent to the street shall provide erosion control, sight distance control, and slope easements as approved by the City Engineer.

c. A grading permit shall be obtained from the Public Works Department Land Development Division prior to commencement of any grading outside of the City maintained road right-of-way.

d. All improvement plans are substantially complete and appropriate clearance and at-risk letters are provided to the City. (MC 9.14.030)

e. The developer shall submit a soils and geologic report to the Public Works Department – Land Development Division. The report shall address the soil's stability and geological conditions of the site.

LD13. (GPA) Prior to grading plan approval, the developer shall select and implement treatment control best management practices (BMPs) that are medium to highly effective for treating Pollutants of Concern (POC) for the project. Projects where National Pollution Discharge Elimination System (NPDES) mandates water quality

treatment control best management practices (BMPs) shall be designed per the City of Moreno Valley guidelines or as approved by the City Engineer.

LD14. (GPA) Prior to approval of the grading plans for projects that will result in discharges of storm water associated with construction with a soil disturbance of one or more acres of land, the developer shall submit a Notice of Intent (NOI) and obtain a Waste Discharger's Identification number (WDID#) from the State Water Quality Control Board (SWQCB). The WDID# shall be noted on the grading plans prior to issuance of the first grading permit.

LD15. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall submit two (2) copies of the final project-specific Water Quality Management Plan (WQMP) for review by the City Engineer that:

a. Addresses Site Design Best Management Practices (BMPs) such as minimizing impervious areas, maximizing permeability, minimizes directly connected impervious areas to the City's street and storm drain systems, and conserves natural areas;
b. Incorporates Source Control BMPs and provides a detailed description of their implementation;
c. Incorporates Treatment Control BMPs and provides information regarding design considerations;
d. Describes the long-term operation and maintenance requirements for BMPs requiring maintenance; and
e. Describes the mechanism for funding the long-term operation and maintenance of the BMPs.

A copy of the final WQMP template can be obtained on the City's Website or by contacting the Land Development Division of the Public Works Department.

LD16. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall record a "Stormwater Treatment Device and Control Measure Access and Maintenance Covenant," to provide public notice of the requirement to implement the approved final project-specific WQMP and the maintenance requirements associated with the WQMP.

A boilerplate copy of the "Stormwater Treatment Device and Control Measure Access and Maintenance Covenant," can be obtained by contacting the Land Development Division of the Public Works Department

LD17. (GPA) Prior to the grading plan approval, or issuance of a building permit, if a grading permit is not required, the Developer shall secure approval of the final project-specific WQMP from the City Engineer. The final project-specific WQMP

shall be submitted at the same time of grading plan submittal. The approved final WQMP shall be submitted to the Storm Water Program Manager on compact disk(s) in Microsoft Word format prior to grading plan approval.

LD18. (GPA) Prior to the grading plan approval, or issuance of a building permit as determined by the City Engineer, the approved final project-specific WQMP shall be incorporated by reference or attached to the project's Storm Water Pollution Prevention Plan as the Post-Construction Management Plan.

LD19. (GPA) Prior to grading plan approval, the developer shall prepare a Storm Water Pollution Prevention Plan (SWPPP) in conformance with the state's Construction Activities Storm Water General Permit. A copy of the current SWPPP shall be kept at the project site and be available for review upon request. The SWPPP shall be submitted to the Storm Water Program Manager on compact disk(s) in Microsoft Word format.

LD20. (GPA) Prior to the approval of the grading plans, the developer shall pay applicable remaining grading plan check fees.

LD21. (GP) Prior to issuance of a grading permit, or building permit when a grading permit is not required, for projects that require a project-specific Water Quality Management Plan (WQMP), a project-specific final WQMP (F-WQMP) shall be approved. Upon approval, a WQMP Identification Number is issued by the Storm Water Management Section and shall be noted on the rough grading plans as confirmation that a project-specific F-WQMP approval has been obtained.

LD22. (GP) Prior to issuance of a grading permit, if the fee has not already been paid prior to map approval or prior to issuance of a building permit if a grading permit is not required, the developer shall pay Area Drainage Plan (ADP) fees. The developer shall provide a receipt to the City showing that ADP fees have been paid to Riverside County Flood Control and Water Conservation District. (MC 9.14.100)

LD23. (GP) Prior to issuance of a grading permit, security, in the form of a cash deposit (preferable), letter of credit, or performance bond shall be required to be submitted as a guarantee of the completion of the grading required as a condition of approval of the project.

LD24. (GP) Prior to issuance of a grading permit, the developer shall pay the applicable grading inspection fees.

<u>Prior to Map Approval or Recordation</u>

LD25. (MA) Prior to approval of the map, the developer shall submit a copy of the Covenants, Conditions and Restrictions (CC&Rs) to the Land Development Division

for review and approval. The CC&Rs shall include, but not be limited to, access easements, reciprocal access, private and/or public utility easements as may be relevant to the project.

LD26. (MA) Prior to approval of the map, all street dedications shall be irrevocably offered to the public and shall continue in force until the City accepts or abandons such offers, unless otherwise approved by the City Engineer. All dedications shall be free of all encumbrances as approved by the City Engineer.

LD27. (MA) Prior to approval of the map, security shall be required to be submitted as a guarantee of the completion of the improvements required as a condition of approval of the project. A public improvement agreement will be required to be executed.

LD28. (MR) Prior to recordation of the map, the developer shall submit the map, on compact disks, in (.dxf) digital format to the Land Development Division of the Public Works Department.

Prior to Improvement Plan Approval or Construction Permit

LD29. (IPA) Prior to approval of the improvement plans, the improvement plans shall be drawn on twenty-four (24) inch by thirty-six (36) inch mylar and signed by a registered civil engineer and other registered/licensed professional as required.

LD30. (IPA) Prior to approval of the improvement plans, the developer shall submit clearances from all applicable agencies, and pay all outstanding plan check fees. (MC 9.14.210)

LD31. (IPA) All public improvement plans prepared and signed by a registered civil engineer in accordance with City standards, policies and requirements shall be approved by the City Engineer in order for the Public Improvement Agreement and accompanying security to be executed.

LD32. (IPA) Prior to approval of the improvement plans, securities and a public improvement agreement shall be required to be submitted and executed as a guarantee of the completion of the improvements required as a condition of approval of the project.

LD33. (IPA) The street improvement plans shall comply with all applicable City standards and the following design standards throughout this project:

a. Corner cutbacks in conformance with City Standard 208 shall be shown on the final map or, if no map is to be recorded, offered for dedication by separate instrument.

b. Lot access to major thoroughfares shall be restricted except at intersections and approved entrances and shall be so noted on the final map. (MC 9.14.100)

c. The minimum centerline and flow line grades shall be one percent unless otherwise approved by the City Engineer. (MC 9.14.020)

d. All street intersections shall be at ninety (90) degrees plus or minus five (5) degrees per City Standard No. 706A, or as approved by the City Engineer. (MC 9.14.020)

LD34. (IPA) Prior to approval of the improvement plans, the plans shall indicate any restrictions on trench repair pavement cuts to reflect the City's moratorium on disturbing newly-constructed pavement less than three years old and recently slurry sealed streets less than one year old. Pavement cuts for trench repairs may be allowed for emergency repairs or as specifically approved in writing by the City Engineer.

LD35. (IPA) Prior to approval of the improvement plans, the developer is required to bring any existing access ramps adjacent to and fronting the project to current ADA (Americans with Disabilities Act) requirements. However, when work is required in an intersection that involves or impacts existing access ramps, those access ramps in that intersection shall be retrofitted to comply with current ADA requirements, unless approved otherwise by the City Engineer.

LD36. (IPA) Prior to approval of the improvement plans, drainage facilities with sump conditions shall be designed to convey the tributary 100-year storm flows. Secondary emergency escape shall also be provided. (MC 9.14.110)

LD37. (IPA) Prior to the approval of the improvement plans, the hydrology study shall show that the 10-year storm flow will be contained within the curb and the 100-year storm flow shall be contained within the street right-of-way. In addition, one lane in each direction shall not be used to carry surface flows during any storm event for street sections equal to or larger than a minor arterial. When any of these criteria is exceeded, additional drainage facilities shall be installed. (MC 9.14.110 A.2)

LD38. (IPA) The project shall be designed to accept and properly convey all off-site drainage flowing onto or through the site. All storm drain design and improvements shall be subject to review and approval of the City Engineer. In the event that the City Engineer permits the use of streets for drainage purposes, the provisions of the Development Code will apply. Should the quantities exceed the street capacity or the use of streets be prohibited for drainage purposes, as in the case where one travel lane in each direction shall not be used for drainage conveyance for emergency vehicle access on streets classified as minor arterials and greater, the

developer shall provide adequate facilities as approved by the Public Works Department – Land Development Division. (MC 9.14.110)

LD39. (CP) All work performed within the City right-of-way requires a construction permit. As determined by the City Engineer, security may be required for work within the right-of-way. Security shall be in the form of a cash deposit or other approved means. The City Engineer may require the execution of a public improvement agreement as a condition of the issuance of the construction permit. All inspection fees shall be paid prior to issuance of construction permit. (MC 9.14.100)

LD40. (CP) Prior to issuance of a construction permit, all public improvement plans prepared and signed by a registered civil engineer in accordance with City standards, policies and requirements shall be approved by the City Engineer.

LD41. (CP) Prior to issuance of construction permits, the developer shall submit all improvement plans on compact disks, in (.dxf) digital format to the Land Development Division of the Public Works Department.

LD42. (CP) Prior to issuance of construction permits, the developer shall pay all applicable inspection fees.

<u>Prior to Building Permit</u>

LD43. (BP) Prior to issuance of a building permit, if the project involves a non-residential subdivision, the map shall be recorded.

LD44. (BP) Prior to issuance of a building permit (excluding model homes), an approval by the City Engineer is required of the water quality control basin(s). The developer shall provide certification to the line, grade, flow test and system invert elevations.

LD45. (BP) Prior to issuance of a building permit, all pads shall meet pad elevations per approved plans as noted by the setting of "Blue-top" markers installed by a registered land surveyor or licensed engineer.

LD46. (BP) Prior to issuance of a building permit, the developer shall submit for review and approval, a Waste Management Plan (WMP) that shows data of waste tonnage, supported by original or certified photocopies of receipts and weight tags or other records of measurement from recycling companies and/or landfill and disposal companies. The Waste Management Plan shall contain the following:

a. The estimated volume or weight of project waste to be generated by material type. Project waste or debris may consist of vegetative materials including trees, tree parts, shrubs, stumps, logs, brush, or any other type of plants that are cleared from a site. Project waste may also include roadwork removal,

rocks, soils, concrete and other material that normally results from land clearing.

b. The maximum volume or weight of such materials that can be feasibly diverted via reuse and recycling.
c. The vendor(s) that the applicant proposes to use to haul the materials.
d. Facility(s) the materials will be hauled to, and their expected diversion rates.
e. Estimated volume or weight of clearing, grubbing, and grading debris that will be landfilled.

Approval of the WMP requires that at least fifty (50) percent of all clearing, grubbing, and grading debris generated by the project shall be diverted, unless the developer is granted an exemption. Exemptions for diversions of less than fifty (50) percent will be reviewed on a case by case basis. (AB939, MC 8.80)

Prior to Certificate of Occupancy

LD47. (CO) Prior to issuance of the last certificate of occupancy or building final, the developer shall pay all outstanding fees.

LD48. (CO) Prior to issuance of a certificate of occupancy, this project is subject to requirements under the current permit for storm water activities required as part of the National Pollutant Discharge Elimination System **(NPDES)** as mandated by the Federal Clean Water Act. In compliance with Proposition 218, the developer shall agree to approve the City of Moreno Valley NPDES Regulatory Rate Schedule that is in place at the time of certificate of occupancy issuance. Following are the requirements:

a. Select one of the following options to meet the financial responsibility to provide storm water utilities services for the required continuous operation, maintenance, monitoring system evaluations and enhancements, remediation and/or replacement, all in accordance with Resolution No. 2002-46.
   i. Participate in the mail ballot proceeding in compliance with Proposition 218, for the Common Interest, Commercial, Industrial and Quasi-Public Use NPDES Regulatory Rate Schedule and pay all associated costs with the ballot process; or
   ii. Establish an endowment to cover future City costs as specified in the Common Interest, Commercial, Industrial and Quasi-Public Use NPDES Regulatory Rate Schedule.

b. Notify the Special Districts Division of the intent to request building permits 90 days prior to their issuance and the financial option selected. The financial option selected shall be in place prior to the issuance of certificate of occupancy. (California Government Code & Municipal Code)

LD49. (CO) The City of Moreno Valley has an adopted Development Impact Fee (DIF) nexus study. All projects unless otherwise exempted shall be subject to the payment of the DIF prior to issuance of occupancy. The fees are subject to the provisions of the enabling ordinance and the fee schedule in effect at the time of occupancy.

LD50. (CO) The City of Moreno Valley has an adopted area wide Transportation Uniform Mitigation Fee (TUMF). All projects unless otherwise exempted shall be subject to the payment of the TUMF prior to issuance of occupancy. The fees are subject to the provisions of the enabling ordinance and the fee schedule in effect at the time of occupancy.

LD51. (CO) Prior to issuance of a certificate of occupancy or building final, the developer shall construct all public improvements in conformance with applicable City standards, except as noted in the Special Conditions, including but not limited to the following applicable improvements:

a. Street improvements including, but not limited to: pavement, base, curb and/or gutter, cross gutters, spandrel, sidewalks, drive approaches, pedestrian ramps, street lights, signing, striping, under sidewalk drains, landscaping and irrigation, medians, redwood header boards, pavement tapers/transitions and traffic control devices as appropriate.

b. Storm drain facilities including, but not limited to: storm drain pipe, storm drain laterals, open channels, catch basins and local depressions.

c. City-owned utilities.

d. Sewer and water systems including, but not limited to: sanitary sewer, potable water and recycled water.

e. Under grounding of existing and proposed utility lines less than 115,000 volts.

f. Relocation of overhead electrical utility lines including, but not limited to: electrical, cable and telephone.

LD52. (CO) Prior to issuance of a certificate of occupancy or building final, all existing and new utilities adjacent to and on-site shall be placed underground in accordance with City of Moreno Valley ordinances. (MC 9.14.130)

LD53. (CO) Prior to issuance of a certificate of occupancy or building final for any Commercial/Industrial facility, whichever occurs first, the owner may have to secure coverage under the State's General Industrial Activities Storm Water Permit as issued by the State Water Resources Control Board.

SPECIAL CONDITIONS

LD54. Prior to parcel map approval, the map shall show the following:

a. A 4-foot minimum pedestrian right-of-way dedication behind any driveway approach per City Standard 118C, on Perris Boulevard, Indian Street, and Grove View Road.

b. A 2-foot public access easement for the portions of sidewalk which are outside of the public right-of-way, along Perris Boulevard and Indian Street.

c. The appropriate additional right-of-way required for a bus turn-out on Perris Boulevard as depicted on the approved project plans and as conditioned by the City's Transportation Department.

d. Corner cutback right-of-way dedications per City Standard 208 at the southeast corner of Indian Street and Grove View Road and the southwest corner of Perris Boulevard and Grove View Road.

LD55. Prior to parcel map approval, the Developer shall guarantee the construction of the following improvements by entering into a public improvement agreement and posting security. The improvements shall be completed prior to occupancy of the first building or as otherwise determined by the City Engineer.

a. Perris Boulevard, Divided Arterial, City Standard 103C (110-foot RW / 86-foot CC) shall be constructed to half-width plus an additional 18 feet east of the centerline, along the entire project's east frontage. Additional right-of-way dedications at driveway approaches as well as a 2-foot pedestrian access easement, along the project's west property line, shall be shown on the parcel map. Improvements shall consist of, but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, any necessary offsite improvement transition/joins to existing, streetlights, pedestrian ramps, removal/relocation and/or undergrounding of any power poles with overhead utility lines less than 115,000 volts, and dry and wet utilities.

b. Indian Street, Minor Arterial, Modified City Standard 105A (88-foot RW / 64-foot CC) shall be constructed to half-width plus an additional 18 feet west of the centerline, along the entire project's east frontage. Additional right-of-way dedications at driveway approaches as well as a 2-foot pedestrian access easement, along the project's west property line, shall be shown on the parcel map. Improvements shall consist of,

but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, streetlights, pedestrian ramps, removal/relocation and/or undergrounding of any power poles with overhead utility lines less than 115,000 volts, and dry and wet utilities.

c. Grove View Road, Industrial Collector, City Standard 106 (78-foot RW / 56-foot CC) shall be constructed to half-width plus an additional 18 feet north of the centerline, along the entire project's north frontage. Additional right-of-way dedications at driveway approaches along the project's north property line, shall be shown on the parcel map.. Improvements shall consist of, but not be limited to, pavement, base, curb, gutter, sidewalk, driveway approaches, drainage structures, any necessary offsite, streetlights, pedestrian ramps, dry and wet utilities.

d. Driveway approaches shall be constructed per City Standard No. 118C or as modified as shown on the project plans. The parcel map shall show an additional 4-foot minimum right-of-way dedication behind driveway approaches. No decorative pavers shall be placed within the public right-of-way. Certain project entrance(s) may be required to be constructed as a public street intersection.

e. Pavement core samples of existing pavement may be taken and findings submitted to the City for review and consideration of pavement improvements. The City will determine the adequacy of the existing pavement structural section. If the existing pavement structural section is found to be adequate, the developer may still be required to perform a one-tenth inch grind and overlay or slurry seal depending on the severity of existing pavement cracking, as required by the City Engineer. If the existing pavement section is found to be inadequate, the Developer shall replace the pavement to meet or exceed the City's pavement structural section standard.

LD56. Prior to precise grading plan or improvement plan approval, as applicable, the plans shall show all driveway approaches to be constructed per City Standard Plan 118C modified, as accepted by the City. There shall be 4-foot minimum wide pedestrian sidewalk area at 2% maximum behind the conventional right-of-way. A minimum 4-foot pedestrian right-of-way dedication shall be made on the final parcel map PM 35672.

LD57. Prior to precise grading plan approval, the grading plan shall show any proposed trash enclosure as dual bin; one bin for trash and one bin for recyclables. The trash enclosure shall be per City Standard Plan 627.

LD58. Prior to precise grading plan approval, the grading plan shall show that the lowest finished floor elevation is a minimum of one foot above the base flood elevation.

LD59. Prior to precise grading plan approval, the grading plans shall clearly show that the parking lot conforms to City standards. The parking lot shall be 5% maximum, 1% minimum, 2% maximum at or near any disabled parking stall and travel way. Ramps, curb openings and travel paths shall all conform to current ADA standards as outlined in Department of Justice's "ADA Standards for Accessible Design", Excerpt from 28 CFR Part 36. (www.usdoj.gov) and as approved by the City's Building and Safety Division.

LD60. Prior to occupancy, the developer shall obtain an encroachment permit from Riverside County Flood Control & Water Conservation District in order to connect proposed onsite storm drain to the Perris Valley Channel Lateral B.

LD61. Prior to occupancy, the developer shall make a good faith effort to cause Riverside County Flood Control & Water Conservation District to dedicate additional public street right-of-way on Indian Street and Perris Boulevard along their property frontage between the project's south property line and the bridges.

LD62. Prior to occupancy, all overhead utility lines less than 115,000 volts fronting or within the entire project site boundary shall be placed underground per Section 9.14.130C of the City Municipal Code.

LD63. The Applicant shall select and implement treatment control BMPs that are medium to highly effective for treating Pollutants of Concern (POC) for the project. POC include project pollutants associated with a 303(d) listing or a Total Maximum Daily Load (TMDL) for receiving waters. Project POC include sediment/turbidity, nutrients, oxygen demanding substances, and pathogens (bacteria and viruses). Exhibit C of the document, "Riverside County Water Quality Management Plan for Urban Runoff" dated July 24, 2006 shall be consulted for determining the effectiveness of proposed treatment BMPs.

LD64. Overall, the proposed treatment control concept is accepted as the conceptual treatment control BMP for the proposed site.

LD65. The Applicant has proposed to incorporate the use of vegetated swales, hydrodynamic separators, and sand filters. Final design details of the treatment control BMPs must be provided in the first submittal of the F-WQMP. The size of the treatment control BMPs is to be determined using the procedures set forth in Exhibit C of the Riverside County Guidance Document.

The Applicant acknowledges that more area than currently shown on the plans may be required to treat site runoff as required by the WQMP guidance.

LD66. The Applicant shall substantiate the applicable Hydrologic Condition of Concern (HCOC) (WQMP Section IV) in the F-WQMP. The HCOC designates that the project will comply with Condition A; therefore, the condition must be addressed in the F-WQMP.

LD67. The Applicant shall, prior to building or grading permit closeout or the issuance of a certificate of occupancy, demonstrate:

a. That all structural BMPs have been constructed and installed in conformance with the approved plans and specifications;

b. That all structural BMPs described in the F-WQMP have been implemented in accordance with approved plans and specifications;

c. That the Applicant is prepared to implement all non-structural BMPs included in the F-WQMP, conditions of approval, and building/grading permit conditions; and

d. That an adequate number of copies of the approved F-WQMP are available for the future owners/occupants of the project.

PUBLIC WORKS DEPARTMENT – SPECIAL DISTRICTS DIVISION

Note: All Special Conditions, Modified Conditions, or Clarification of Conditions are in bold lettering. All other conditions are standard to all or most development projects.

Acknowledgement of Conditions

The following items are Special Districts' Conditions of Approval for project **PA09-0004**; this project shall be completed at no cost to any Government Agency. All questions regarding Special Districts' Conditions including but not limited to, intent, requests for change/modification, variance and/or request for extension of time shall be sought from the Special Districts Division of the Public Works Department 951.413.3480. The applicant is fully responsible for communicating with each designated Special Districts staff member regarding their conditions.

General Conditions

SD1. The parcel(s) associated with this project have been incorporated into the Moreno Valley Community Services Districts Zones A (Parks & Community Services) and C (Arterial Street Lighting). All assessable parcels therein shall be subject to annual Zone A and Zone C charges for operations and capital improvements.

SD2. Plans for parkway, median, slope, and/or open space landscape areas designated on the tentative map or in these Conditions of Approval for incorporation into Moreno Valley Community Services District **Zone M**, shall be prepared and submitted in accordance with the *City of Moreno Valley Public Works Department Landscape Design Guidelines*. Contact the Special Districts Division of the Public Works Department to obtain copies of this document.

SD3. The developer, or the developer's successors or assignees shall be responsible for all parkway and/ or median landscaping maintenance until such time as the District accepts maintenance duties.

SD4. Any damage to existing landscape easement areas due to project construction shall be repaired/replaced by the developer, or developer's successors in interest, at no cost to the Moreno Valley Community Services District.

Prior to Building Permit Issuance

SD5. (BP) This project has been identified to be included in the formation of a Community Facilities District (Mello-Roos) for **Public Safety** services, including but not limited to Police, Fire Protection, Paramedic Services, Park Rangers, and Animal Control services. The property owner(s) shall not protest the formation; however, they retain the right to object to the rate and method of maximum special tax. In compliance

with Proposition 218, the developer shall agree to approve the mail ballot proceeding (special election) for either formation of the CFD or annexation into an existing district that may already be established. The Developer must notify Special Districts of intent to request building permits 90 days prior to their issuance. (California Government Code)

SD6. (BP) This project is conditioned to provide a funding source for the capital improvements and/or maintenance for the **Perris Blvd.** median landscape. In order for the Developer to meet the financial responsibility to maintain the defined service, one of the following options shall be selected:

a. Participate in the mail ballot proceeding in compliance with Proposition 218, for Moreno Valley Community Services District **Zone M** (Commercial, Industrial and Multifamily Improved Median Maintenance), and pay all associated costs with the ballot process; or

b. Establish an endowment to cover the future maintenance costs of the landscaped area.

The developer must notify Special Districts of intent to request building permits 90 days prior to their issuance and the financial option selected to fund the continued maintenance.

SD7. *Commercial* (BP) If Land Development, a Division of the Public Works Department, requires this project to supply a funding source necessary to provide, but not limited to, stormwater utilities services for the monitoring of on site facilities and performing annual inspections of the affected areas to ensure compliance with state mandated stormwater regulations, the developer must notify Special Districts 90 days prior to the City's issuance of a building permit and the financial option selected to fund the continued maintenance. (California Government Code)

SD8. (BP) Prior to release of building permit, the developer, or the developer's successors or assignees, shall record with the County Recorder's Office a **Declaration of Covenant and Acknowledgement of Assessments** for each assessable parcel therein, whereby the developer covenants and acknowledges the existence of the Moreno Valley Community Services District, its established benefit zones, and that said parcel(s) is (are) liable for payment of annual benefit zone charges and the appropriate National Pollutant Discharge Elimination System (NPDES) maximum regulatory rate schedule when due. A copy of the recorded Declaration of Covenant and Acknowledgement of Assessments shall be submitted to the Special Districts Division.

**For a copy of the Declaration of Covenant and Acknowledgement of the Assessments form, please contact Special Districts, phone 951.413.3480.

SD9. (BP) Final median, parkway, slope, and/or open space landscape/irrigation plans for those areas designated on the tentative map or in these Conditions of Approval for inclusion into Community Services District shall be reviewed and approved by the Community Development Department–Planning Division, and the Public Works Department–Special Districts and Transportation Divisions prior to the issuance of the first Building Permit.

Prior to Certificate of Occupancy

SD10. (CO) Prior to issuance of a Certificate of Occupancy or building final, the developer shall submit a letter to Special Districts from the Utility service responsible for providing final electrical energy connections and energization of the streetlights for the development project. The letter must identify, by pole number, each streetlight in the development and state the corresponding date of its electrical energization.

SD11. (CO) All parkway and/or median landscaping specified in the tentative map or in these Conditions of Approval shall be constructed prior to the issuance of the Certificate of Occupancy/Building Final for this project.

SD12. (CO) Prior to the issuance of the first Certificate of Occupancy or building final for this project, the developer shall pay Advanced Energy fees for all applicable Zone B (Residential Street Lighting) and/or Zone C (Arterial Street Lighting and Intersection Lighting) streetlights required for this development. The developer shall provide a receipt to the Special Districts Division showing that the Advanced Energy fees have been paid in full for the number of streetlights to be accepted into the CSD Zone B and/or Zone C program. Payment shall be made to the City of Moreno Valley, as collected by the Land Development Division, based upon the Advanced Energy fee rate at the time of payment and as set forth in the current Listing of City Fees, Charges and Rates, as adopted by City Council. Any change in the project which may increase the number of streetlights to be installed will require payment of additional Advanced Energy fees at the then current fee.

PUBLIC WORKS DEPARTMENT – TRANSPORTATION ENGINEERING DIVISION

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects.

Based on the information contained in our standard review process we recommend the following conditions of approval be placed on this project:

GENERAL CONDITIONS

TE1. Conditions of approval may be modified if project is phased or altered from any approved plans.

TE2. Perris Boulevard is classified as a Divided Arterial (110'RW/86'CC) per City Standard Plan No. 103C. The sidewalk shall be curb-separated. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

TE3. Indian Street is designated as a Minor Arterial (88'RW/64'CC) per City Standard Plan No. 105A. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

TE4. Grove View Road is designated as an Industrial Collector (78'RW/56'CC) per City Standard Plan No. 106. Any modifications or improvements undertaken by this project shall be consistent with the City's standards for this facility.

PRIOR TO GRADING PERMIT

TE5. (GP) Prior to issuance of a grading permit, the project applicant shall submit conceptual striping plans for improvements identified in condition TE11 as well as Indian Street for the City Traffic Engineer's approval.

PRIOR TO IMPROVEMENT PLAN APPROVAL OR CONSTRUCTION PERMIT

TE6. The driveways less than 40 feet in width shall conform to Section 9.16.250, and Table 9.16.250A of the City's Development Code - Design Guidelines, and City Standard Plan No. 118C. Driveways wider than 40' shall be designed as intersections with pedestrian access ramps per City standards.

TE7. Sight distance at driveways and on streets shall conform to City of Moreno Valley Standard No. 125A, B, C at the time of preparation of final grading, landscape, and street improvements.

TE8. Prior to the final approval of the street improvement plans, a signing and striping plan shall be prepared per City of Moreno Valley Standard Plans - Section 4 for all streets with a cross section of 66'/44' and wider.

TE9. Prior to issuance of a construction permit, construction traffic control plans prepared by a qualified, Registered Civil or Traffic engineer may be required.

TE10. Prior to the final approval of the street improvement plans, the project applicant shall design Perris Boulevard to include a bus bay per City Standard

Plan No. 121 in the southbound direction, south of Grove View Road. The bus bay may be designed to serve as a combination right turn lane/bus bay to the satisfaction of the City Engineer.

TE11. Prior to the final approval of the street improvement plans, the project applicant shall design the intersection/traffic signal at Perris Boulevard and the South Project Driveway to provide the following (at a minimum):

Northbound: One left turn lane, one shared through/right turn lane
Southbound: One left turn lane, one through lane, one right turn lane
Eastbound: One left turn lane, one shared through/right turn lane
Westbound: One left turn lane, one shared through/right turn lane

NOTE: The curb return radii on the northwest/southwest corners shall be 50 feet.

TE12. Prior to the final approval of the street improvement plans, the project applicant shall design and modify the intersection of Perris Boulevard at Grove View Road to include a 200' northbound left turn lane with raised median. This modification may include relocation of the traffic detector loops and other traffic signal modifications.

<u>PRIOR TO BUILDING PERMIT</u>

TE13. (BP) Prior to issuance of a building permit, traffic signal plans shall be prepared by a registered civil or electrical engineer and shall be submitted to the City Traffic Engineer for the following intersections:

- **Perris Boulevard at South Project Driveway (signal modifications).**
- **Perris Boulevard at Grove View Road (signal modifications).**

TE14. (BP) Prior to issuance of a building permit, the project applicant shall make a fair-share contribution in the amount of $45,150 to the City of Moreno Valley for the construction of a traffic signal at Perris Boulevard and Suburban Lane. As this traffic signal is not in any existing fee program, payment of DIF and/or TUMF are not considered satisfaction of this obligation.

<u>PRIOR TO CERTIFICATE OF OCCUPANCY OR BUILDING FINAL</u>

TE15. (CO) Prior to issuance of a certificate of occupancy, all approved signing and striping shall be installed per current City Standards and the approved plans.

TE16. (CO) Each gated entrance shall be provided with the following, or as approved by the City Traffic Engineer:

a) A storage lane with a minimum of 75 feet queuing length for entering traffic.
b) Appropriate signing and striping.

All of these features must be kept in working order.

TE17. (CO) Prior to the issuance of a certificate of occupancy, the project applicant shall construct the traffic signal modifications identified in TE13. Construction shall be completed per the approved plans and coordinated with the street improvements.

TE18. (CO) Prior to issuance of a certificate of occupancy, the project applicant shall construct the intersection/roadway improvements identified in TE10, TE11, and TE12 per the approved plans.

TE19. (CO) Prior to the issuance of a certificate of occupancy for the project, driveway access at the following locations will be installed as follows:

- **North Perris Boulevard Driveway: Right-in, right-out access by means of a raised median.**
- **South Perris Boulevard Driveway: Full access by means of a traffic signal.**
- **Grove View Road Driveways: Full access.**
- **Indian Street Driveways: Full access.**

NOTE: All truck driveways shall have curb return radii of 50 feet.

<u>PRIOR TO ACCEPTANCE OF STREETS INTO THE CITY-MAINTAINED ROAD SYSTEM</u>

TE20. Prior to the acceptance of streets into the City-maintained road system, all approved traffic control and signing and striping shall be installed per current City Standards and the approved plans.

PUBLIC WORKS DEPARTMENT – MORENO VALLEY UTILITY

Note: All Special Conditions, Modified Conditions, or Clarification of Conditions are in bold lettering. All other conditions are standard to all or most development projects.

Acknowledgement of Conditions

The following items are Moreno Valley Utility's Conditions of Approval for project(s) PA09-0004 & PA09-0012; this project shall be completed at no cost to any Government Agency. All questions regarding Moreno Valley Utility's Conditions including but not limited to, intent, requests for change/modification, variance and/or request for extension of time shall be sought from Moreno Valley Utility (the Electric Utility Division) of the Public Works Department 951.413.3512. The applicant is fully responsible for communicating with Moreno Valley Utility staff regarding their conditions.

PRIOR TO RECORDATION OF FINAL MAP

MVU1. (R) For single family subdivisions, a three foot easement along each side yard property line shall be shown on the final map and offered for dedication to the City of Moreno Valley for public utility purposes, unless otherwise approved by the City Engineer. If the project is a multi-family development, townhome, condominium, apartment, commercial or industrial project, and it requires the installation of electric distribution facilities within common areas, a non-exclusive easement shall be provided to Moreno Valley Utility to include all such common areas. All easements shall include the rights of ingress and egress for the purpose of operation, maintenance, facility repair, and meter reading.

PRIOR TO ISSUANCE OF BUILDING PERMIT

MVU2. (BP) **City of Moreno Valley Municipal Utility Service – Electrical Distribution**: Prior to issuance of building permit, the developer shall submit a detailed engineering plan showing design, location and schematics for the utility system to be approved by the City Engineer. In accordance with Government Code Section 66462, the Developer **shall** execute an agreement with the City providing for the installation, construction, improvement and dedication of the utility system following recordation of final map and concurrent with trenching operations and other subdivision improvements so long as said agreement incorporates the approved engineering plan and provides financial security to guarantee completion and dedication of the utility system.

The Developer **shall** coordinate and receive approval from the City Engineer to install, construct, improve, and dedicate to the City, or the City's designee, all utility infrastructure (including but not limited to conduit, equipment, vaults, ducts, wires, switches, conductors, transformers, resistors, amplifiers, and "bring-up"

facilities including electrical capacity to serve the identified development and other adjoining/abutting/ or benefiting projects as determined by Moreno Valley Utility) – collectively referred to as "utility system" (to and through the development), along with any appurtenant real property easements, as determined by the City Engineer to be necessary for the distribution and /or delivery of any and all "utility services" to each lot and unit within the Tentative Map. For purposes of this condition, "utility services" shall mean electric, cable television, telecommunication (including video, voice, and data) and other similar services designated by the City Engineer. "Utility services" shall not include sewer, water, and natural gas services, which are addressed by other conditions of approval. Properties within development will be subject to an electrical system capacity charge and that contribution will be collected prior to issuance of building permits.

The City, or the City's designee, shall utilize dedicated utility facilities to ensure safe, reliable, sustainable and cost effective delivery of utility services and maintain the integrity of streets and other public infrastructure. Developer shall, at developer's sole expense, install or cause the installation of such interconnection facilities as may be necessary to connect the electrical distribution infrastructure within the project to the Moreno Valley Utility owned and controlled electric distribution system. Alternatively, developer may cause the project to be included in or annexed to a community facilities district established or to be established by the City for the purpose of financing the installation of such interconnection and distribution facilities. The project shall be deemed to have been included in or annexed to such a community facilities district upon the expiration of the statute of limitations to any legal challenges to the levy of special taxes by such community facilities district within the property. The statute of limitations referred to above will expire 30 days after the date of the election by the qualified electors within the project to authorize the levy of special taxes and the issuance of bonds.

MVU3. This Project is **subject** to a Reimbursement Agreement. The Project is responsible for a proportionate share of costs associated with electrical distribution infrastructure previously installed that directly benefits the Project. The developer shall be responsible to pay to the City of Moreno Valley the sum of **$423,150.00** for this electrical distribution infrastructure prior to the issuance of building permits.

POLICE DEPARTMENT

Note: All Special conditions are in bold lettering. All other conditions are standard to all or most development projects

Standard Conditions

PD1. Prior to the start of any construction, temporary security fencing shall be erected. The fencing shall be a minimum of six (6) feet high with locking, gated access and shall remain through the duration of construction. Security fencing is required if there is: construction, unsecured structures, unenclosed storage of materials and/or equipment, and/or the condition of the site constitutes a public hazard as determined by the Public Works Department. If security fencing is required, it shall remain in place until the project is completed or the above conditions no longer exist. (MC 9.08.080)

PD2. (GP) Prior to the issuance of grading permits, a temporary project identification sign shall be erected on the site in a secure and visible manner. The sign shall be conspicuously posted at the site and remain in place until occupancy of the project. The sign shall include the following:

a. The name (if applicable) and address of the development.

b. The developer's name, address, and a 24-hour emergency telephone number. (MC 9.08.080)

PD3. (CO) Prior to the issuance of a Certificate of Occupancy, an Emergency Contact Information Form for the project shall be completed at the permit counter of the Community & Economic Development Department - Building Division for routing to the Police Department. (MC 9.08.080)

1. INTRODUCTION

The Final Environmental Impact Report (EIR) for the proposed VIP Moreno Valley project is composed of the Draft EIR State Clearinghouse No. 2011081084 and Appendices; the Response to Comments; and the Findings, Statement of Overriding Considerations, Staff Reports, and Resolutions. Specifically, this document portion of the EIR includes the Comments and Responses volume of the Final EIR, EIR modifications or errata, and the Mitigation Monitoring and Reporting Program (MMRP). The purpose of this document is to respond to all comments received by the City of Moreno Valley (City) regarding the environmental information and analyses contained in the Draft EIR. Additionally, any corrections to the text and figures of the Draft EIR, generated either from responses to comments or independently by the City, are stated in this volume of the Final EIR. The Draft EIR text has not been modified to reflect these clarifications.

1.1 CONTENT AND FORMAT

Subsequent to this introductory section, Section 2.0 contains copies of each comment letter received on the Draft EIR, along with annotated responses to each comment contained within the letters, Section 3.of this document contains corrections and errata to the Draft EIR. Section 4.0 contains the Mitigation Monitoring and Reporting Plan, which includes additional measures developed as a part of this Final EIR.

1.2 PUBLIC REVIEW OF THE DRAFT EIR

As required by the California Environmental Quality Act (CEQA) Guidelines Section 15087, a Notice of Completion (NOC) of the Draft EIR State Clearinghouse No. 2011081084 for the VIP Moreno Valley project was filed with the State Clearinghouse on April 20, 2012 and the Notice of Availability (NOA) of the Draft EIR was filed with the Riverside County Clerk on April 20, 2012

The Draft EIR was circulated for public review for a period of 45 days, from April 20, 2012 to June 4, 2012. Copies of the Draft EIR were distributed to all Responsible Agencies and to the State Clearinghouse in addition to various public agencies, citizen groups, and interested individuals. Copies of the Draft EIR were also made available for public review at the City Planning Department, at one area library, and on the internet.

A total of ten comment letters was received. Seven of the comment letters received were from Federal, State, regional, or local agencies. One comment letter was received from a citizen group and two letters from individuals. All ten letters have been responded to within this document. Comments that address environmental issues are thoroughly responded to in Section 2.0.

1.3 POINT OF CONTACT

The Lead Agency for this Project is the City of Moreno Valley. Any questions or comments regarding the preparation of this document, its assumptions, or its conclusions, should be referred to:

Jeff Bradshaw, Associate Planner
City of Moreno Valley, Planning Division
14177 Frederick Street

e-mail: jeffreyb@moval.com

MV00170137

1.4 PROJECT SUMMARY

The following information is summarized from the Project Description in the Draft EIR. For additional detail in regard to Project characteristics and Project-related improvements, along with analyses of the Project's potential environmental impacts, please refer to Draft EIR Sections 3.0 and 4.0, respectively.

1.4.1 Project Location

The project site is located in the City of Moreno Valley, Riverside County. The approximately 71-acre site is generally located on the southwest corner of Perris Boulevard and Grove View Road. The Perris Valley Storm Drain Lateral B channel forms the southern boundary of the site while Indian Street forms the western boundary.

1.4.2 Proposed Project

The proposed development would result in the construction and operation of approximately 1,616,133 square feet of distribution warehouse uses on an approximately 71-acre site. The single building will be constructed with 264 vertical-lift dock-high roll up doors on the long (north and south) sides of the building to allow access for the loading and unloading of products from diesel truck/trailers. The building will include a total of approximately 44,000 square feet of business office space for the management of the warehouse. Parking at the warehouse will be provided for 368 trucks and trailers as well as 589 parking stalls for passenger vehicles in accordance with City standards for light industrial uses.

1.4.3 Project Objectives

The purpose of the proposed project is to provide a new facility specializing in warehouse distribution services. Upon development, the proposed project will achieve the following:

Create employment-generating opportunities for the citizens of Moreno Valley and surrounding communities;

Encourage industrial development as attractive and productive uses while minimizing conflicts with the surrounding existing uses;

Encourage warehouse distribution services that take advantage of the area's close proximity to various freeways and transportation corridors;

Provide the infrastructure improvements required to meet project needs in an efficient and cost-effective manner;

Encourage new development consistent with the capacity and municipal service capabilities;

Provide a high density, high-quality large-scale industrial development to provide jobs for residents at a variety of income levels;

Facilitate the efficient and cost-effective movement of goods in and through the City, which, in turn, allows the City to compete economically on a domestic and international scale;

Provide an industrial warehouse facility that meets the substantial and unmet demands of businesses located in the City and County;

MV00170138

Cluster industrial warehouse uses near efficient access points to the state highway system to reduce traffic congestion on surface streets and to reduce associated air pollutant emissions from vehicle sources;

Implement the City's General Plan Industrial/Business Park Land Use designations that are applicable to the site;

Accommodate new development that channels land uses in a phased, orderly manner and is coordinated with the provision of necessary infrastructure and public improvements;

Provide new development that will assist the City in obtaining fiscal balance in the years and decades ahead; and

Address community circulation, both vehicular and pedestrian, utilizing available capacity within the existing circulation system, and provide fair share improvements to various future-year deficient intersections or road segments.

1.4.4 Required Permits and Discretionary Actions

The following discretionary actions are anticipated to be taken by the City of Moreno Valley as part of the proposed project:

Tentative Parcel Map approval (TPM 36162);

Certification of Environmental Impact Report; and

Site Plan approval.

Other non-discretionary actions anticipated to be taken by the City at the Staff level as part of the proposed project include the following:

Approval of a Storm Water Pollution Prevention Plan (SWPPP) to accommodate site runoff during construction. Approval of a Water Quality Management Plan (WQMP) to mitigate for post-construction runoff flows.

Issuance of a Grading permit that requires approval of a grading plan, approval of the final drainage study, approval of the Final WQMP, obtaining an NOI and WDID number, and satisfying those conditions of approval required prior to grading.

Issuance of an Encroachment permit for any construction work done in any City-controlled right-of-way. Encroachment permit issuance requires approval of improvement plans, public improvement agreement execution with securities posted, and satisfying those conditions of approval required prior to grading.

Issuance of a Building permit. The comprehensive building permit includes building, plumbing, mechanical, and electrical permits.

Approvals and permits required by other agencies include:

A National Pollutant Discharge Elimination System (NPDES) permit from the Regional Water Quality Control Board (RWQCB) to ensure that downstream water quality is not worsened.

Approval of water and sewer improvement plans by the Eastern Municipal Water District.

Approval from the City and Riverside County Flood Control and Water Conservation District to ensure that construction site drainage velocities are equal to or less than the pre-construction conditions.

2. RESPONSE TO COMMENTS

A total of ten comment letters was received. Seven of the comment letters received were from Federal, State, regional, or local agencies. One comment letter was received from a citizen group and two letters from individuals. All ten letters have been responded to within this document. Comments that address environmental concerns have been thoroughly addressed. Comments that (1) do not address the adequacy or completeness of the Draft EIR; (2) do not raise environmental issues; or (3) do request the incorporation of additional information not relevant to environmental issues do not require a response, pursuant to Section 15088(a) of the State CEQA Guidelines.

Section 15088 of the State CEQA Guidelines, Evaluation of and Response to Comments, states:

a) The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments received during the noticed comment period and any extensions and may respond to late comments.

b) The written response shall describe the disposition of significant environmental issues raised (e.g., revisions to the proposed project to mitigate anticipated impacts or objections). In particular, major environmental issues raised when the lead agency's position is at variance with recommendations and objections raised in the comments must be addressed in detail, giving the reasons that specific comments and suggestions were not accepted. There must be good faith, reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice.

c) The response to comments may take the form of a revision to the draft EIR or may be a separate section in the final EIR. Where the response to comments makes important changes in the information contained in the text of the draft EIR, the lead agency should either:

   1. Revise the text in the body of the EIR; or
   2. Include marginal notes showing that the information is revised in the responses to comments.

Information provided in this volume of the Final EIR clarifies, amplifies, or makes minor modifications to the Draft EIR. No significant changes have been made to the information contained in the Draft EIR as a result of the responses to comments, and no significant new information has been added that would require recirculation of the document.

An Errata to the EIR (Section 3.0) has been prepared to make minor corrections and clarifications to the Draft EIR as a result of City review and comments received during the public review period. Therefore, this Response to Comments document, along with the Errata is included as part of the Final EIR for consideration by the Planning Commission prior to a vote to certify the Final EIR.

2.1 LIST OF PERSONS, ORGANIZATIONS, AND PUBLIC AGENCIES COMMENTING ON THE DRAFT EIR

The persons, organizations, and public agencies that submitted comments regarding the Draft EIR through June 4, 2012, are listed below. A total of ten comment letters was received. Seven of the comment letters received were from Federal, State, regional, or local agencies. One comment letter

MV00170140

was received from a citizen group and two letters from individuals. Each comment letter received is indexed with a number below.

Comment Letters Received Regarding the Draft EIR

A **California Native American Heritage Commission (May 14, 2012)**
Dave Singleton, Program Analyst

B **California Department of Fish and Game (May 21, 2012)**
Jeff Brandt, Senior Environmental Specialist

C **Gerald M. Budlong (May 31, 2012)**

D **Johnson & Sedlack (June 1, 2012)**
Ray Johnson, AICP, Esq.

E **Sierra Club, San Gorgonio Chapter (June 3, 2012)**
George Hague, Conservation Chair
Moreno Valley Chapter

F **California Department of Transportation, District 8 (June 4, 2012)**
Daniel Kopulsky, Office Chief
Community Planning/IGR-CEQA

G **Eastern Municipal Water District (June 4, 2012)**
Joseph B. Lewis
Director of Engineering Services

H **United States Fish and Wildfire Service (e-mail June 4, 2012)**
Nicole Ronan, Fish and Wildfire Service

I **Riverside County Flood Control and Water Conservation District**
Mekbib Degaga, Engineering Project Manager

J **California Governor's Office of Planning and Research, State Clearinghouse**
Scott Morgan, Director State Clearinghouse

2.2 FORMAT OF RESPONSES TO COMMENTS

Aside from the courtesy statements, introductions, and closings, individual comments within the body of each letter have been identified and numbered. A copy of each comment letter and the City's responses are included in this section. Brackets delineating the individual comments and an alphanumeric identifier have been added to the right margin of the letter. Responses to each comment identified are included on the page(s) following each comment letter. Responses to comments were sent to the agencies that provided comments.

In the process of responding to the comments, there were minor revisions to the Environmental Impact Report. None of the comments or responses constitutes "significant new information" (*CEQA Guidelines* Section 15073.5) that would require recirculation of the Environmental Impact Report.

Re: SCH#2011081084; CEQA Notice of Completion; draft Environmental Impact Report (DEIR) for the **"VIP Moreno Valley Project – PA09-0004 (plot Plan) PA09-0012 (TPM 36162) P11-020 (EIR);"** located in the City of Moreno Valley; Riverside, California.

Dear Mr. Bradshaw:

The Native American Heritage Commission (NAHC), the State of California 'Trustee Agency' for the protection and preservation of Native American cultural resources pursuant to California Public Resources Code §21070 and affirmed by the Third Appellate Court in the case of EPIC v. Johnson (1985: 170 Cal App. 3rd 604).

This letter includes state and federal statutes relating to Native American historic properties of religious and cultural significance to American Indian tribes and interested Native American individuals as 'consulting parties' under both state and federal law. State law also addresses the freedom of Native American Religious Expression in Public Resources Code §5097.9. 1

The California Environmental Quality Act (CEQA – CA Public Resources Code 21000-21177, amendments effective 3/18/2010) requires that any project that causes a substantial adverse change in the significance of an historical resource, that includes archaeological resources, is a 'significant effect' requiring the preparation of an Environmental Impact Report (EIR) per the CEQA Guidelines defines a significant impact on the environment as 'a substantial, or potentially substantial, adverse change in any of physical conditions within an area affected by the proposed project, including ...objects of historic or aesthetic significance." In order to comply with this provision, the lead agency is required to assess whether the project will have an adverse impact on these resources within the 'area of potential effect (APE), and if so, to mitigate that effect. 2 The NAHC did conduct a Sacred Lands File (SLF) search within the 'area of potential effect (APE) with the following results: Native American cultural resources were not found within the APE. However, the absence of archaeological resources does not preclude their existence at the subsurface level and may be exposed during construction activity. 3

The NAHC "Sacred Sites,' as defined by the Native American Heritage Commission and the California Legislature in California Public Resources Code §§5097.94(a) and 5097.96. Items in the NAHC Sacred Lands Inventory are confidential and exempt from the Public Records Act pursuant to California Government Code §6254 (r). 4

Early consultation with Native American tribes in your area is the best way to avoid unanticipated discoveries of cultural resources or burial sites once a project is underway. 5

Culturally affiliated tribes and individuals may have knowledge of the religious and cultural significance of the historic properties in the project area (e.g. APE). We strongly urge that you make contact with the list of Native American Contacts on the attached list of Native American contacts, to see if your proposed project might impact Native American cultural resources and to obtain their recommendations concerning the proposed project. Pursuant to CA Public Resources Code § 5097.95, the NAHC requests cooperation from other public agencies in order that the Native American consulting parties be provided pertinent project information. Consultation with Native American communities is also a matter of environmental justice as defined by California Government Code §65040.12(e). Pursuant to CA Public Resources Code §5097.95, the NAHC requests that pertinent project information be provided consulting tribal parties. The NAHC recommends *avoidance* as defined by CEQA Guidelines §15370(a) to pursuing a project that would damage or destroy Native American cultural resources and Section 2183.2 that requires documentation, data recovery of cultural resources. 5

Furthermore, the NAHC if the proposed project is under the jurisdiction of the statutes and regulations of the National Environmental Policy Act (e.g. NEPA; 42 U.S.C. 4321-43351). Consultation with tribes and interested Native American consulting parties, on the NAHC list, should be conducted in compliance with the requirements of federal NEPA and Section 106 and 4(f) of federal NHPA (16 U.S.C. 470 *et seq*), 36 CFR Part 800.3 (f) (2) & .5, the President's Council on Environmental Quality (CSQ, 42 U.S.C 4371 *et seq.* and NAGPRA (25 U.S.C. 3001-3013) as appropriate. The 1992 *Secretary of the Interiors Standards for the Treatment of Historic Properties* were revised so that they could be applied to all historic resource types included in the National Register of Historic Places and including cultural landscapes. Also, federal Executive Orders Nos. 11593 (preservation of cultural environment), 13175 (coordination & consultation) and 13007 (Sacred Sites) are helpful, supportive guides for Section 106 consultation. The aforementioned Secretary of the Interior's *Standards* include recommendations for all 'lead agencies' to consider the historic context of proposed projects and to "research" the cultural landscape that might include the 'area of potential effect.' 6

Confidentiality of "historic properties of religious and cultural significance" should also be considered as protected by California Government Code §6254(r) and may also be protected under Section 304 of he NHPA or at the Secretary of the Interior discretion if not eligible for listing on the National Register of Historic Places. The Secretary may also be advised by the federal Indian Religious Freedom Act (cf. 42 U.S.C., 1996) in issuing a decision on whether or not to disclose items of religious and/or cultural significance identified in or near the APEs and possibility threatened by proposed project activity. 7

Furthermore, Public Resources Code Section 5097.98, California Government Code §27491 and Health & Safety Code Section 7050.5 provide for provisions for inadvertent discovery of human remains mandate the processes to be followed in the event of a discovery of human remains in a project location other than a 'dedicated cemetery'. 8

To be effective, consultation on specific projects must be the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors, in the opinion of the NAHC. Regarding tribal consultation, a relationship built around regular meetings and informal involvement with local tribes will lead to more qualitative consultation tribal input on specific projects. 9

Finally, when Native American cultural sites and/or Native American burial sites are prevalent within the project site, the NAHC recommends 'avoidance' of the site as referenced by CEQA Guidelines Section 15370(a). 10

If you have any questions about this response to your request, please do not hesitate to contact me at (916) 653-6251.

Sincerely,

Dave Singleton
Program Analyst

This list is applicable for contacting local Native Americans with regard to cultural resources for the proposed SCH#2011081084; CEQA Notice of Completion; draft Environmental Impact Report (DEIR) for the VIP Moreno Valley Project; located in the City of Moreno Valley; Riverside County, California.

2.4 RESPONSE TO LETTER A

California Native American Heritage Commission

Response to Comment A-1. The comment is introductory and states that the Native American Heritage Commission (NAHC) is the State "trustee agency" pursuant to Public Resources Code Section 21070 for the protection and preservation of the State's Native American resources. The comment also states that the letter contains state and federal statutes relating to Native American historic properties of religious and cultural significance.

The comment is introductory in nature and outlines the NAHC's authority and role as a commenting agency. The NAHC's introduction in this comment is noted, and no further response is required.

Response to Comment A-2. The comment states that CEQA requires that any project that causes a substantial adverse change in the significance of a historical resource, which includes archaeological resources, is a "significant effect" requiring the preparation of an EIR. A Draft EIR was prepared for the proposed project and circulated for public review on April 20, 2012. Based on the *Phase I Cultural Resources Assessment and Paleontological Records Review* prepared for the proposed project, the site contains a historic site and a historic isolate, which were recorded and evaluated for significance in accordance with CEQA. Based on the study, it was determined that the historic resource and historic isolate were not considered to be significant. Consequently, construction and grading of the proposed project site will not affect significant historic resources, resulting in a less than significant impact.

Response to Comment A-3. The comment states that the NAHC Sacred Lands File (SLF) search found that no Native American cultural resources were identified within the project area. Similarly, the Draft EIR determined that there were no cultural resources (historic or prehistoric) identified on the project site as a result of records searches or during on site reconnaissance. The comment does not contain any substantive statements or questions about the Draft EIR or the analysis therein. Therefore, no further response is necessary.

Response to Comment A-4. The comment states that NAHC Sacred Sites are confidential and exempt from the Public Records Act pursuant to California Government Code Section 6254. The City acknowledges the sensitivity and confidentiality of the information contained in the cultural resources report. No records maps have been made public nor will they be made public in association with the City's consideration of the proposed project.

Response to Comment A-5. The comment states that pursuant to California Public Resources Code Section 5097.95, the NAHC requests that pertinent project information be provided to Native American consulting parties, and that Native American consultation is a matter of environmental justice. The comment letter states that early consultation with Native American Tribes in the area of the project site is the best way to avoid unanticipated discoveries once a project is underway. The letter includes a list of Native American contacts and recommends obtaining their recommendations concerning the proposed project.

Appendix B-5 of the Draft EIR contains the Phase I Cultural Resource Assessment and Paleontological Records Review, (Michael Brandman Associate., March 27, 2012) prepared for the proposed project in which Native American consultation was conducted. On February 15, 2007, Michael Brandman Associates sent a letter to the NAHC in an effort to determine whether any sacred sites were listed on the Scared Lands Files for this area of Moreno Valley containing the project site.

MV00170147

In response to the Sacred Land Record Search request, the NAHC identified fourteen Native American contacts that may have knowledge of cultural resources in the project area.

Letters dated February 28, 2007, were sent by MBA to the fourteen Native American contacts provided by the NAHC. The letters notified the parties of the proposed project and requested that the tribes respond with information concerning cultural resources that might be affected.

Response to Comment A-6. The comment states that consultation with Tribes and interested Native American consulting parties on the NAHC list should be conducted in compliance with the requirements of federal National Environmental Policy Act (NEPA), Sections 106 and 4(f) of the National Historic Preservation Act, and the Native American Grave Protection and Repatriation Act (NAGPRA), as appropriate.

The project is not a federal undertaking as defined under Section 106 of the National Historic Preservation Act (NHPA) or 36 Code of Federal Regulations (CFR) Part 800 regulations implementing Section 106. The project does not use federal funds and will not require any federal permits. Therefore, the project does not fall under the regulatory oversight of Section 106. The project is not a federal transportation project, so it also does not fall under the jurisdiction of Section 4(f) of the Department of Transportation Act of 1966. Finally, since there is no federal involvement in the project, the requirements of NAGPRA do not apply.

As described in Response to Comment A-5, above, the City conducted consultation with fourteen local tribes and interested Native American individuals for the project. Consultation included providing those parties with pertinent project and location information.

Response to Comment A-7. The comment states that historic properties of religious and cultural significance are confidential and protected by California Government Code Section 6254. The comment further states that the confidentiality of such resources may also be protected by section 304 of the NHPA. The City acknowledges the sensitivity and confidentiality of any identified resources. The SLF and any associated records maps are not for public distribution. In addition, because the project is not a federal undertaking, it is not regulated under Section 304 of the NHPA.

Response to Comment A-8. The comment identifies State laws regarding the accidental discovery of human remains. In in the unlikely event that human remains are encountered during project grading, the County Coroner and the City Planning Division would be notified immediately, and no further disturbance would occur until the County Coroner makes a determination of origin and disposition. If the remains are determined to be Native American, the County Coroner would notify the NAHC, which will determine and notify the most likely descendant (MLD). Implementation of state law reduces potential impacts related to the discovery of human remains on the proposed project site to a less than significant level, and no additional mitigation is required.

Response to Comment A-9. The comment states that effective consultation, in the opinion of the NAHC, is the result of an ongoing relationship between Native American tribes and lead agencies, project proponents and their contractors. The City agrees that effective consultation is desired. The City has reached out to Native American tribes through the consultation process (as detailed in the Draft EIR in Appendix B-5).The comment does not contain any substantive statements or questions about the Draft EIR or the analysis therein. Therefore, no further response is necessary.

Response to Comment A-10. The comment states that the NAHC recommends avoidance when a project would damage or destroy Native American cultural resources. The comment further states that documentation and data recovery of such resources is required pursuant to the CEQA

Guidelines. Based on the *Phase I Cultural Resources Assessment and Paleontological Records Review* prepared for the proposed project, the site has a low potential for containing archeological resources due to the lack of such resources previously discovered in the surrounding area and the disturbed nature of the project site. Consequently, construction and grading of the proposed project site will have a low probability of damaging archeological resources. Impacts to archeological resources are considered to be less than significant.

CITY OF MORENO VALLEY
Planning Division

Mr. Jeff Bradshaw
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92551

Subject: Draft Environmental Impact Report for the VIP Moreno Valley Project
City of Moreno Valley, Riverside County -- SCH #2011081084

Dear Mr. Bradshaw:

The Department of Fish and Game (Department) appreciates this opportunity to comment on the Draft Environmental Impact Report for the VIP Moreno Valley Project. The Department is responding as a Trustee Agency for fish and wildlife resources [Fish and Game Code sections §711.7 and 1802 and the California Environmental Quality Act Guidelines (CEQA) section §15386] and as a Responsible Agency regarding any discretionary actions (CEQA Guidelines section §15381), such as a Lake and Streambed Alteration Agreement (California Fish and Game Code Sections §1600 et seq.) and/or a Permit for Incidental Take of Endangered, Threatened, and/or Candidate species (Fish and Game Code Sections 2080 and 2080.1).

The proposed Project consists of the construction and operation of approximately 1,616,133 square feet of distribution warehouse uses on a 71-acre site. The Project is located in the City of Moreno Valley and is bounded on the west by Indian Street, on the east by Perris Boulevard, on the north by Grove View Road and on the south by the Perris Valley Storm Drain. The March Air Reserve Base and the Interstate-215 (I-215) are located in the vicinity to the west. The site has been used for dryland farming and is disked. There is vegetation (mostly non-native) on the periphery of the site but the major part of the site is disked.

Western Riverside Multiple Species Habitat Conservation Plan (MSHCP)

The Department is responsible for ensuring appropriate conservation of fish and wildlife resources including rare, threatened, and endangered plant and animal species, pursuant to the California Endangered Species Act (CESA), and administers the Natural Community Conservation Plan Program (NCCP Program). On June 22, 2004, the Department issued Natural Community Conservation Plan Approval and Take Authorization for the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) per Section §2800, et seq., of the California Fish and Game Code. The MSHCP establishes a multiple species conservation program to minimize and mitigate habitat loss and the incidental take of covered species in association with activities covered under the permit.

The proposed Project occurs within the MSHCP area and is subject to the provisions and policies of the MSHCP. The City of Moreno Valley is the Lead Agency and is signatory to the 1

implementing agreement of the MSHCP. Compliance with approved habitat plans, such as the MSHCP, is discussed in CEQA. Specifically, Section 15125(d) of the CEQA Guidelines requires that the DEIR discuss any inconsistencies between a proposed Project and applicable general plans and regional plans, including habitat conservation plans and natural community conservation plans. An assessment of the impacts to the MSHCP as a result of this Project is necessary to address CEQA requirements.

The Project is located in the Reche Canyon/Badlands Area Plan but does not contain any Criteria Cells and the site is not necessary for reserve assembly. MSHCP policies and procedures that apply to the proposed Project include Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools policy (MSHCP section 6.1.2 pp 6-20; "Riparian/Riverine and Vernal Pool Policy"), Protection of Narrow Endemic Plant Species (MSHCP section 6.1.3 pp 6-28; "NEPPSA"), and Additional Survey Needs and Procedures (MSHCP section 6.3.2, Additional Survey Needs and Procedures). 1

A) Special Survey Areas

The Project is located within the survey area for the western burrowing owl (WBO). WBO is a State Species of Special Concern and is a species subject to the Migratory Bird Treaty Act (MBTA). Focused surveys for the WBO were conducted in 2009. The results of the focused surveys indicate that there were no direct observations or sign of the WBO. 2

B) Protection of Narrow Endemic Plant Species

Plant species requiring habitat assessments include: San Diego ambrosia, many-stemmed dudleya, spreading navarretia, California Orcutt grass, Wrights trichocoronis, Coulter's goldfields, Davidson's saltscale, little mousetail, mud nama, Parish's brittlescale, round-leaved filaree, San Jacinto Valley crownscale, smooth tarplant, and threat-leaved brodiaea. Focused NEPS and Criteria Area surveys were conducted in 2009. The 2009 surveys determined that the NEPS and Criteria Area Plants have a low potential for occurrence because of the absence of suitable habitat and the disking of the site. The DEIR conclusions are supported by the surveys for the Perris Boulevard Widening Project. 3

C) Riparian/Riverine Areas, Vernal Pools, and Fairy Shrimp

A narrow, north-south trending agricultural drainage ditch bisects the center of the site and terminates at a culvert entering the Perris Valley Storm Drain. The document states that the "drainage ditch" does not meet the requirements of this MSHCP policy. The Department reserves the right to determine whether the on-site channel is jurisdictional. 4

<u>Impacts to the species</u>

The biological report states that the only vegetation on the site is located on the periphery because of ongoing disking and consists primarily of non-native plants. Wildlife on the site includes: red-tailed hawk, American kestrel, common raven, American crow, Brewer's blackbird, Say's phoebe, western kingbird, western meadowlark, mourning dove, side-blotched lizard, western fence lizard, California ground squirrel, desert cottontail and pocket gopher. 5

Proposed mitigation

Impacts to wildlife are covered by the MSHCP and the mitigation requirements in the MSHCP. The DEIR states that preconstruction surveys will be conducted for WBO and nesting birds. If WBO are found on the site the Resource Conservation Agency and the Department should be notified to determine whether additional mitigation measures are required. 6

Department Concerns

The Department reserves the right to determine whether the channel on site is subject to Section 1600 *et seq.* in the Fish and Game Code. A Determination of Biologically Equivalent or Superior Preservation (DBESP) alternative is not required, according to the DEIR. The Department needs to be notified prior to commencement of grading if bird nests or burrowing owl are identified in pre-construction surveys. In addition, a Lake and Streambed Alteration Agreement (Section 1600 *et seq.*) may be required. No mitigation has been provided for the loss of this channel. 7

Lake and Streambed Alteration Agreement

Although the proposed Project is within the Western Riverside Multiple Species Habitat Conservation Plan (MSHCP) and is not subject to Section 6.1.2, Protection of Species Associated with Riparian/Riverine Areas and Vernal Pools, a Lake and Streambed Alteration Agreement Notification may still be required by the Department should the site contain jurisdictional waters. Additionally, the Department's criteria for determining the presence of jurisdictional waters are more comprehensive than the MSHCP criteria in Section 6.1.2.

A routine delineation was conducted in 2009 and the consultants determined that there were no jurisdictional wetlands or streams on the site. However, the Department retains the right to determine whether the resources on site are jurisdictional waters and subject to the Lake and Streambed Alteration Agreement program. A new streambed jurisdictional delineation needs to be conducted to determine whether the channel (i.e., "drainage ditch") conveys water across the site, particularly during the rainy season, and how many linear feet or acres comprise the channel. 8

The Department recommends submitting a notification early on, since modification of the proposed Project may be required to avoid or reduce impacts to fish and wildlife resources. To obtain a Streambed Alteration Agreement notification package, please call (562) 430-7924 or go to http://www.dfg.ca.gov/habcon/1600/forms.html. 9

If the CEQA documents do not fully identify potential impacts to lakes, streams, and associated resources and provide adequate avoidance, mitigation, monitoring, funding sources, a habitat management plan and reporting commitments, additional CEQA documentation will be required prior to execution (signing) of the Agreement. In order to avoid delays or repetition of the CEQA process, potential impacts to a stream or lake, as well as avoidance and mitigation measures need to be discussed within this CEQA document. Permit negotiations conducted after and outside of the CEQA process are not CEQA-compliant because they deprive the public and agencies of their right to know what project impacts are and how they are being mitigated (CEQA Section 15002). 10

The Department opposes the elimination of ephemeral, intermittent and perennial stream channels, lakes and their associated habitats. The Department recommends avoiding the stream and riparian habitat to the greatest extent possible. Any unavoidable impacts need to be compensated with the creation and/or restoration of in-kind habitat either on-site or off-site at a minimum 3:1 replacement-to-impact ratio, depending on the impacts and proposed mitigation. Additional mitigation requirements through the Department's Streambed Alteration Agreement process may be required depending on the quality of habitat impacted, proposed mitigation, project design, and other factors.

The following information will be required for the processing of a Streambed Alteration Agreement and the Department recommends incorporating this information to avoid subsequent CEQA documentation and project delays: 11

1) Delineation of lakes, streams, and associated habitat that will be temporarily and/or permanently impacted by the proposed project (include an estimate of impact to each habitat type);
2) Discussion of avoidance measures to reduce project impacts; and,
3) Discussion of potential mitigation measures required to reduce the project impacts to a level of insignificance.

Please refer to section 15370 of the CEQA guidelines for the definition of mitigation. If the project does not include the criteria listed above, the Department believes that it cannot fulfill its obligations as a Trustee and Responsible Agency for fish and wildlife resources.

We recommend that the Department's concerns be addressed in the Final Environmental Impact Report.

Sincerely,

Jeff Brandt
Senior Environmental Scientist

cc: State Clearinghouse

2.6 RESPONSE TO LETTER B

California Department of Fish and Game

Response to Comment B-1. The commentor accurately summarizes both the CEQA requirement for an analysis of the proposed project's consistency with the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) and the MSHCP policies and procedures applicable to the proposed project.

Response to Comment B-2. The commentor accurately summarizes both the MSHCP requirement for a burrowing owl survey and that the surveys conducted for the project showed no burrowing owl sign or observations.

Response to Comment B-3. The commentor accurately summarizes both the MSHCP requirement for survey of narrow endemic plant species and that the surveys conducted for the project determined there is a low potential for occurrence of the species due to lack of suitable habitat and disking of the site. The commentor also notes these conclusions are consistent with the surveys conducted for the Perris Boulevard Widening Project (which is a City of Moreno Valley capital improvement project) and not related to the VIP Moreno Valley Project.

Response to Comment B-4. The commentor notes the Draft EIR statement that the agricultural ditch running north-south across the center of the site is not jurisdictional and indicates CDFG reserves the right to determine whether the on-site ditch is jurisdictional. As stated in the Draft EIR (pages 2-10 and 2-11), the ditch no longer contains the characteristics of jurisdictional waters. This is due to the construction of Grove View Road and storm drains on the north side of the site, resulting in the elimination of an abundant supply of off-site water flow from the north onto the site. Because the ditch no longer carries the abundant supply off-site water flow, it no longer supports the one riparian species (willow) that exists in the ditch. This condition has become even more evident over the past several years, resulting in no jurisdictional waters on the site.

Response to Comment B-5. The commentor accurately summarizes the vegetation and wildlife observed on the site.

Response to Comment B-6. The commentor accurately summarizes the Draft EIR mitigation measure prescribing preconstruction surveys for burrowing owl and nesting birds, and requests that the Regional Conservation Authority and CDFG be contacted should burrowing owl be found on the site in order to determine the need for additional mitigation. This is standard operating procedure, and the project proponent's biological consultant will comply.

Response to Comment B-7. The commentor identifies CDFG's concerns which are summarized as follows: 1) Regarding the on-site ditch that runs north-south through the center of the project site, CDFG states that they reserve the right to determine whether the site is jurisdictional, and if so, a Section 1600 permit would be required for the loss of the on-site ditch; and 2) CDFG requests that they be notified prior to grading activities if bird nests or burrowing owls or observed during the pre-construction surveys required as part of Mitigation Measures BIO-1 through BIO-4.

Response to Comment B-8. The commentor notes that CDFG's criteria for determining jurisdictional waters are more comprehensive than the MSHCP criteria and requests that a new jurisdictional delineation be conducted.. As stated in the Response to Comment B-4, the Draft EIR has already identified that the on-site ditch no longer accepts off-site water flows during storm events because off-site flows now are conveyed to a storm drain located in Grove View Road. The eastern section of Grove View Road between Perris Boulevard and Indian Street was constructed in 2007 while the

MV00170154

western section was constructed in 2009 as part of the two warehouse projects located across the street and north of the proposed project. The conditions observed in the 2009 jurisdictional delineation prepared by Ecological Sciences are still valid, and in fact, the lack of jurisdictional waters has become more obvious due to the lack of off-site water conveyance.

Response to Comment B-9. The commentor provides contact information regarding submittals for Section 1600 permit. Refer to Responses to Comments B-4 and B-9. The project contains no jurisdictional waters, a Section 1600 Streambed Alteration Agreement is not required, and this information is therefore not applicable.

Response to Comment B-10. Refer to Responses to Comments B-4, B-9, and B-10.

Response to Comment B-11. Refer to Responses to Comments B-4, B-9, and B-10.

Letter C

RECEIVED

Moreno Valley, CA 92557
May 31, 2012

Subject: Proposed VIP Moreno Valley Distribution Center DEIR

Jeff Bradshaw, Associate Planner
Moreno Valley Planning Division
14177 Frederick Street, Moreno Valley City Hall
Moreno Valley, CA 92553

Dear Mr. Bradshaw:

The proposed VIP Moreno Valley Distribution Center project is consistent with the present specific plan as well as the superseded Oleander Specific Plan of the Moreno Valley General Plan and the zoning ordinance. My opinion of this industrial site concerning prime farmland, remains the same since 1989. The land has been designated as industrial in the specific plans and the zoning ordinance. The land has not met the state definition of prime farmland for the last 20 years or more due to the lack of acreage remaining of the land designated prime farmland on the state map. Viable crops grown on prime farmland have not been commercially possible for quite some time. Much of the site is already developed into industrial uses. 1

My only concern of the subject DEIR is the omission of groundwater levels and associated adverse impacts such as liquefaction. Why are high groundwater levels and liquefaction issues missing from this EIR?

The environmental cleanup program, called the Installation Restoration Program (IRP),at March Field, incorporating the former March AFB and present March ARB, has monitored the groundwater levels on and off base since the start of this program in the late 1980s. The groundwater levels have been rising an average of one to two feet annually. To date local groundwater levels are as high as 10 feet or less from the ground surface. Projects such as the new MWD water pipeline parallel to I-215 and near the March Field Museum has undergone high groundwater conditions which has prevented completion of approximately 400 linear yards of the project. A new bidding process inviting contractors with expertise in high groundwater conditions was initiated. The Air Force is concerned that the high groundwater conditions may adversely impact foundations at the base. The Air Force is concerned about potential adverse impacts from liquefaction in the event of a future earthquake. It was reported at the April 2012 March Field IRP Board meeting, that underground cement utility vaults at the former DHL airfreight building was experiencing flooding. I inquired whether the flooding was caused by high groundwater conditions. Staff promised they will make inquiries and report back at the October IRP meeting. 2

Are the building foundations for the proposed project engineered for high groundwater level conditions and potential liquefaction events from major earthquakes? 3

Sincerely,

Gerald M. Budlong

Gerald M. Budlong.

2.8 RESPONSE TO LETTER C

Gerald M. Budlong

Response to Comment C-1. The City appreciates the comments provided on the proposed project regarding the project being consistent with the City's General Plan and zoning code as well as comments on prime farmland and the area not being viable for farming since 1989. The comments are part of the public record and will be forwarded to the City's decision makers for their consideration prior to approving the project and certifying the EIR.

Response to Comment C-2. Appendix B-6 of the Draft EIR contains the *Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California (*NorCal Engineering, May 7, 2007) prepared for the proposed project. The geotechnical investigation consisted of forty (40) subsurface exploratory trenches by a backhoe to depths ranging 5-15 feet below current elevations. The report stated "no ground water was encountered in any of the trenches (page 2). This study indicated that the groundwater levels are greater than 100 feet below the surface and the site has a low potential for liquefaction (page 5). The Draft EIR also provided this information in Section 2.5.4 Geology and Soils, page 2-14 which states *"Liquefaction typically occurs in areas where groundwater is shallower than approximately 30 feet, and where there is the presence of loose, sandy soils. According to the City's General Plan, liquefaction is not considered to be a local hazard since groundwater levels in Moreno Valley are far below the surface.*[1] *The project's geotechnical analysis*[2] *indicates that the depth of groundwater within the project vicinity is in excess of 100 feet. The proposed project site is not located in an area identified as being prone to liquefaction. The potential for earthquake-induced liquefaction within the proposed project is considered very low.*[3] *Because liquefaction at the project site is considered to be very low, a less than significant impact related to liquefaction would occur."*

Response to Comment C-3. The proposed project will be built per the City's and State's building code requirements and those contained in the geotechnical study prepared for the proposed project. The building code includes provisions for seismic safety.

---

RE: Moreno Valley Vogel Industrial Park (VIP) Draft Environmental Impact Report Comments

Greetings:

On behalf of the Sierra Club, Moreno Valley Group, and Residents for a Livable Moreno Valley, I hereby submit these comments on the Moreno Valley VIP Draft Environmental Impact Report (DEIR). (PA09-0004, PA09-0012, TPM No. 36162)

Project Summary:

The proposed development would result in the construction and operation of approximately 1,616,133 square feet of distribution warehouse uses on an approximately 71-acre site. The single building will be constructed with 264 vertical-lift dock-high roll up doors on the long (north and south) sides of the building to allow access for the loading and unloading of products from diesel truck/trailers. The building will include a total of approximately 44,000 square feet of business office space for the management of the warehouse. Parking at the warehouse will be provided for 368 trucks and trailers as well as 589 parking stalls for passenger vehicles in accordance with City standards for light industrial uses. See Figure 1.2. 1

The project is located approximately 1.3 miles east of I-215, 4.5 miles south of SR-60, and 1.75 miles west of Lake Perris. March Air Reserve Base is located approximately one half mile west of the project site. Residences are located to the west of the site.

Letter D

General Comments:

The California Environmental Quality Act (CEQA) was adopted as a disclosure and transparency document. The theory is that by providing a document that adequately describes the environmental consequences of a project to decision makers and the public, the decision makers will make a rational decision based upon the true environmental consequences of the project and if they do not, the electorate can hold them accountable for their decisions. The core of this statutory structure is the adequacy of the document as an informational document. 2

Unfortunately, the Draft EIR for this Project fails as an informational document. The EIR misleads decision makers and the public as to the extent and severity of the Project's environmental impacts. On top of these inadequacies, the Draft EIR is almost constantly conclusory, and does not provide the analysis or examination required by CEQA to inform the public and decision makers of the analytical pathway taken from facts to conclusions. Moreover, the EIR evaluates only impacts to Agricultural and Forest Resources, Air Quality, Greenhouse Gas Emissions and Global Climate Change, Noise, and Traffic. The EIR determines, without basis in CEQA, to *not* evaluate in detail impacts which *are potentially significant* but which will be mitigated below a level of significance, including impacts to Biological Resources, Cultural Resources, Geology and Soils, and Hydrology and Water Quality. While effects determined not be significant need not be discussed in detail in the EIR, effects which may be significant must be evaluated, and then the mitigation measures or alternatives which would reduce or avoid that effect must be described. (Public Res. C. § 21002.1(a), (e); State CEQA Guidelines § 15128, 15126, 15123) The EIR fails as an informational document by failing to analyze and evaluate **all potentially significant environmental effects of the project,** relying instead on the cursory evaluation performed for the environmental assessment. By failing to provide information on the potentially significant effects of the project that can be mitigated below a level of significance, the EIR fails as an informational document. The findings are also not supported by substantial evidence in the record, but rather only by the baseless conclusions cited in the EIR. 3 4

CEQA also requires that where feasible mitigation exists which can substantially lessen the environmental impacts of a project, **all feasible mitigation** must be adopted. In this way CEQA goes beyond its informational role to require that projects substantively lessen their negative effects on the environment. It is critical to proper drafting of an EIR that all feasible mitigation measures be required of a project. This has not been done with this Project. For instance, the EIR fails to require *any* mitigation for the project's significant impacts to agricultural resources. Moreover, all mitigation measures required in the EIR must be fully enforceable and certain to occur. This Project fails to ensure that all feasible mitigation will occur with this Project and instead provides vague, uncertain, and unenforceable approximations of mitigation measures. 5 6

Letter D

For instance, several "alternatives" listed in the EIR will not satisfy the actual mitigation required, while other mitigation measures merely require the incorporation of writings, not actions. 7

The Moreno Valley VIP project purports to be a "green project" that is environmentally forward thinking; this is simply not the case, and in fact, the Moreno Valley VIP industrial building will be the *least* green building constructed in Moreno Valley in the past 3 years. The EIR provides examples of typical green building features, but fails to require each of those features for this project. The project only requires LEED certification and does not explain why requiring a gold or platinum LEED certification is infeasible, despite having significant air quality and greenhouse gas impacts. 8

Correspondingly, while most of the project's environmental effects will be a result of its use as a distribution center and corresponding traffic and air quality impacts, not the effects of the warehouse building itself, little if any mitigation is required to reduce these impacts. Regarding traffic effects, the EIR relies heavily on TUMF and DIF programs and concludes that significant effects will be either immediately or promptly reduced by these programs. To the contrary, a significant amount of the streets impacted are not currently planned or funded for improvements, and given the underfunding of these programs are unlikely to see any improvement in the near term. The EIR accordingly understates the traffic and air quality impacts of the project and fails to require all feasible mitigation. 9 10

The EIR also fails to make adequate findings, based on substantial evidence, that the environmentally superior alternative is infeasible. In fact, the environmentally superior alternative satisfies most, if not all project objectives and significant reduces project impacts, particularly with regards to air quality in an area known to have some of the worst air quality in the nation. At the least, the environmentally superior alternative must be implemented in lieu of the project. 11

Further shortcomings of the EIR are detailed below.

Aesthetics

The finding of less than significant impact is not supported regarding lighting. The EIR acknowledges that the project will create a new source of substantial light, but fails to discuss this impact on nighttime views. 12

Agricultural Resources

The project will result in a significant and unmitigated individual and cumulative impact to agricultural resources by converting ***Prime Farmland, Unique Farmland, and Farmland of Statewide Importance***, to non-agricultural use; and would involve other changes in the existing environment which would result in the conversion of Farmland to non-agricultural use. 13

Specifically, the project site is entirely identified as Prime Farmland, Farmland of Statewide Importance, and Farmland of Local Importance. Loss of State Designated Farmland as a result of this project is a significant impact, and accounts for a substantial percent of farmland conversion for Riverside County. The project site's Land Evaluation and Site Assessment score further demonstrates a significant impact from the conversion of quality land and agricultural resources. 14

The EIR plays down the effect of development and operation of industrial uses in increasing development pressure on adjacent agricultural properties. The EIR does not disclose the predicted impacts on properties adjacent to the project site or along the truck routes used to access the project site, as well as city wide impacts. 15

No mitigation is required to reduce the significant adverse impacts of this project to agriculture. While the EIR identifies many mitigation measures that may be implemented, it fails to require any mitigation. The fact that the General Plan EIR found mitigation to be infeasible on a citywide scale does not mean that project level mitigation here is infeasible.

Mitigation measures identified by the CDC to reduce agricultural impacts include: 16

- The purchase of agricultural conservation easements;
- Transfer of development rights;
- Acquisition of farmland by the city or county;
- mitigation banking;
- the establishment of "urban limits," greenbelts, and buffers;
- the payment of in-lieu fees sufficient to a purchase and maintain farmland conservation easements;
- and planning tools such as clustering development, use of density bonuses, and limiting "leapfrog" development.

While the measures regarding planning have been determined to be infeasible by the City, ***the EIR does not provide evidence to support the finding of infeasibility with regard to the purchase or transfer of development rights, conservation easements, or donation of funds to assist in the preservation of agricultural lands.*** The conclusion of the EIR that these measures for mitigation of agricultural land are contrary to the City's vision and therefore not feasible is unsupported. The purchase of conservation easements must be required as mitigation barring evidence of infeasibility. The purchase of a permanent agricultural conservation easement of land of at least 2:1 of equal quality must be required to mitigate for impacts from the direct and growth inducing/cumulative loss of agricultural land by either the outright purchase of easements or donation of mitigation fees to a local, regional, or statewide organization that provides for acquisition and stewardship of agricultural conservation easements. Such mitigation is not found to be infeasible. 17

Air Quality

The project will result in significant and unavoidable impacts to air quality during construction and operation. 18

Letter D

Several of the construction air quality impact "mitigation measures" are required by law, and therefore do not qualify as "mitigation." 19

Existing air quality in the project vicinity generally exceeds state and federal air quality standards for Ozone, Coarse Particulate Matter (PM10), Fine Particulate Matter (PM2.5) for the year. The nearest sensitive receptors to the project are rural residences located approximately 1,000ft north of the project site and 0.5 miles southwest of the project site. 20

The EIR fails to disclose all Moreno Valley General Plan Policies relevant to air pollutant emissions. Such omitted policies and objectives include:

- Ultimate Goal VII: achieve a community which "Emphasizes public health and safety…" 21
- Goal 6.1: "To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property."
- Objective 7.5 "Encourage efficient use of energy resources."
- Policies 7.5.1; 7.5.2; 7.5.5 regarding energy efficiency.

The EIR finds that the project would, "add jobs resulting from the development of the industrial uses to the City, with the potential to minimize the VMT traveled within the project site and community." This potential may not be recognized and is unsupported by evidence in the record and are countered by recent projects within Moreno Valley. For instance, the Sketchers project nearby likewise promised job opportunities for local Moreno Valley workers. However, when all was said and done the facility resulted in a net job loss, and most employees were transferred from Ontario, increasing vehicle miles travelled. (*See, "Moreno Valley: Sketchers' warehouse has caused net job loss,"* The Press Enterprise, Jack Katzanek, February 1, 2012. < http://www.pe.com/business/business-headlines/20120201-moreno-valley-skechers-warehouse-has-caused-net-job-loss.ece>) 22

The project use will also be truck distribution; hence despite any local employment at the warehouse, the project will not minimize VMT and will not minimize air pollutant emissions consistent with the AQMP, but will instead drastically increase mobile source emissions. In fact, the focus of the AQMP is to attain PM 2.5 standards, which this project will specifically add to through the use of diesel trucks. (See AQMP 4-1.)The finding that the project is consistent with the AQMP is entirely unsupported. 23

Health Risks

The EIR finds that the project will have less than significant operational-acute health risk impacts on the basis that, "studies …have not provided sufficient information to establish a short-term non-cancer health risk guidance value for respiratory impacts." This ignores entirely the threshold of significance which asks "Would the proposed project expose sensitive receptors to substantial pollutant concentrations?" and does not necessarily require a health risk guidance value. 24

Operational-Chronic Health Risk Impacts are determined to be less than significant. It is unclear 25

from the EIR that levels at the sensitive receptors of Table 4.2.H were measured, as the EIR states, "Sensitive receptors were placed in a general grid extending in all directions to characterize the risk level surrounding the project site." In the immediate vicinity of the project site are residences, the Rancho Verde High School (one mile to the east of the project site), and El Potrero Elementary School (one mile to the northeast of the project). The EIR does not demonstrate that impacts at these and other locations were evaluated, particularly given the increased susceptibility of infants, children, and the elderly to health impacts from diesel PM. 25

Moreover, the HRA accounts only for the cancer risk and temporary respiratory impacts caused by this project. In addition to the risk of cancer, diesel PM is known to cause immune system effects; reproductive, developmental, and endocrine effects; nervous system effects; and lung health problems, as recognized by the County in the General Plan. Immune system effects include increased allergic inflammatory responses and suppression of infection fighting ability. Diesel PM has also been associated with reproductive effects such as decreased sperm production, changes in fetal development, low birth weight and other impacts. Diesel PM exposure may also cause impairment to the central nervous system. (*The Health Effects of Air Pollution on Children*, Michael T. Kleinman, Ph.D, Fall 2000, <http://aqmd.gov/forstudents/health_effects_on_children.html#WhyChildren>; *See also, Diesel and Health in America: the Lingering Threat*, Clean Air Task Force, February 2005, <http://www.catf.us/resources/publications/files/Diesel_Health_in_America.pdf>) 26

SCAQMD has stated with regards to the health effects from diesel PM:

> "Diesel particles consist mainly of elemental carbon and other carbon-containing compounds… Diesel particles are microscopic…Due to their minute size, diesel particles can penetrate deeply into the lung. There is evidence that once in the lung, diesel particles may stay there for a long time.
>
> In addition to particles, diesel exhaust contains several gaseous compounds including carbon monoxide, nitrogen oxides, sulfur dioxide and organic vapors, for example formaldehyde and 1,3-butadiene. Formaldehyde and 1,3-butadiene have been classified as toxic and hazardous air pollutants. Both have been shown to cause tumors in animal studies and there is evidence that exposure to high levels of 1,3-butadiene can cause cancer in humans…
>
> Diesel emissions may also be a problem for asthmatics. Some studies suggest that children with asthma who live near roadways with high amounts of diesel truck traffic have more asthma attacks and use more asthma medication.
>
> Some human volunteers, exposed to diesel exhaust in carefully controlled laboratory studies, reported symptoms such as eye and throat irritation, coughing, phlegm production, difficulty breathing, headache, lightheadedness, nausea and perception of unpleasant odors. Another laboratory study, in which volunteers were exposed to relatively high levels of diesel particles for about an hour, showed that such exposures could cause lung inflammation." (*The Health Effects of Air Pollution on Children, supra*; *See also, Mira Loma Commerce Center EIR No. 450, Air Quality, Section 4.*) 27

Furthermore, infants, children, and the elderly are more susceptible to diesel PM and its associated health impacts. Given this project's close proximity to two schools, the Rancho Verde High school (1 mile east) and El Potrero Elementary School (1 mile northeast) this increased susceptibility is extremely relevant. With regards to infants and children, increased susceptibility to TACs and diesel PM exists for a variety of reasons. Children are generally more active than adults, have higher respiration rates, and inhale more pollutants deeper into the lung. Children also have more lung surface area in proportion to their body size and inhale more air pound for pound when compared to adults, taking in 20 to 50 percent more air and associated air pollutants than adults. When compared to adults, children spend more active time outdoors in polluted air environments and exert themselves harder than adults when playing outside. Importantly, this exposure to high pollutant levels in children occurs while their lungs are still developing, and therefore has more severe impacts on this sensitive group. (*The Health Effects of Air Pollution on Children, supra.*) 28

This increased susceptibility to air pollutant emissions for children has resulted in the California EPA Office of Environmental Health Hazard Assessment ("OEHHA") weighting cancer risk by a factor of 10 for exposures to carcinogens from birth to two years old, and by a factor of 3 for exposures from 2 years old to 15 years old. (*Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures*, California EPA OEHHA Air Toxicology and Epidemiology Branch, April 2009, p. 3. <http://www.oehha.ca.gov/air/hot_spots/pdf/TSDCPFApril_09.pdf.>) It is unclear that these increased risks were accounted for in the EIR. Additionally, recent studies conducted by SCAQMD's Brain and Lung Tumor and Air Pollution Foundation have found a specific connection between exposure to diesel PM and brain cancer in children. (Annual Meeting of the Brain & Lung Tumor and Air Pollution Foundation, April 2, 2010, <http://www.aqmd.gov/hb/2010/April/100425a.htm>) 29

In addition to an increased risk of cancer, the effects of diesel PM on children include slowed lung function and growth, increased emergency room visits, increased incidences of asthma and bronchitis, crib death, asthma respiratory infections, allergic symptoms, and asthma hospitalizations. (*Diesel and Health in America: the Lingering Threat*, *supra.*)

This project will contribute to an already dire TAC situation in Riverside County. The Riverside County Planning Commission recently considered GPA 1096, an amendment to the General Plan to add a Healthy Communities Element which seeks to reduce hazardous air quality impacts to environmental and human health. The Healthy Communities Element of the General Plan was approved in view of the following significant health impacts resulting from already poor air quality in Riverside County: 30

- ***Asthma-Related Hospitalizations***: In 2005, the greatest percentage of asthma-related hospitalizations were among those under age 18 (38%) followed by those over 65 (19%). Blacks experienced the greatest rate of hospitalizations in 2005 at 225.7 per 100,000 population, versus 99.5 and 81.2 for Hispanics and whites, respectively. 31
- ***Risk of Cancer from Diesel Soot and Other Toxic Air Pollutants: Whereas the regional risk of cancer from diesel soot and other toxic air pollutants dropped by 8 percent between 1998 and 2005, the cancer risk in Riverside County increased by 2 percent.*** 32

- Poor air quality costs Riverside and San Bernardino around ***$6.3 billion annually*** in health care expenses.
- 19% of private schools, 11% of public schools, an 21% of licensed child care centers in Riverside County are located within a quarter (1/4) mile of a major highway.
- Around 350,000 Riverside County residents live within a half (1/2) mile of a major highway, including about 40,000 children under age 5.
- Five schools in Riverside County rank in the 10th percentile for air quality, meaning that 90 percent of the schools in the country had better air. Twenty-five schools ranked in the 50th percentile or below. 32

Recognizing these present and unacceptable consequences of air pollution to the health of Riverside's residents, particularly children and the elderly, the County General Plan and recently approved Healthy Communities Element have adopted General Plan policies pertinent to this project.

Construction Impacts

The EIR erroneously categorizes construction impacts as "Construction Equipment Exhaust Emissions." While some construction air quality impacts arise from construction equipment exhaust, other emissions exceed the threshold of significance from architectural coatings (ROG), paving, and fugitive dust during site preparation and grading, including the importations of 220,000cy of soil (NOx and PM10). 33

Table 4.2.1 relies on construction phasing not required of the project. For example, paving will result in 3434lbs/day of NOX emissions, 34 times the SCAQMD threshold. However, the EIR finds that, on a "Peak Day," NOX emissions will be only 390 lbs/day. This reduction is unsupported. Also, paving emissions for ROG are unclear (5.95.9?), but divide into 90 lbs/day on a peak day. Hence, while the EIR correctly finds that construction air quality impacts are significant and require mitigation, it fails to disclose the severity of that impact. Additional mitigation measures are also feasible to further reduce construction air quality emissions including the following:

1. Gravel pads must be installed at all access points to prevent tracking of mud onto public roads.
2. Install and maintain trackout control devices in effective condition at all access points where paved and unpaved access or travel routes intersect (eg. Install wheel shakers, wheel washers, and limit site access.) 34
3. All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.
4. Pave all construction roads.
5. Pave all construction access roads at least 100 feet on to the site from the main road.
6. Limit fugitive dust sources to 20 percent opacity.
7. Require a dust control plan for earthmoving operations.
8. When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of

the container shall be maintained.

9. All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.
10. The contractor or builder shall designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite.
11. Post a publicly visible sign with the telephone number and person to contact regarding dust complaints. This person shall respond and take corrective action within 24 hours.
12. Extend grading period sufficiently to reduce air quality impacts below a level of significance.
13. The simultaneous disturbance of the site shall be limited to five acres per day.
14. Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.
15. Any on-site stockpiles of debris, dirt or other dusty material shall be covered or watered three times daily.
16. Any site access points within 30 minutes of any visible dirt deposition on any public roadway shall be swept or washed.
17. A high wind response plan shall be formulated for enhanced dust control if winds are forecast to exceed 25 mph in any upcoming 24-hour period. 34
18. Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.*
19. Develop a trip reduction plan to achieve a 1.5 AVR for construction employees
20. Require high pressure injectors on diesel construction equipment.*
21. Restrict truck operation to "clean" trucks, such as a 2007 or newer model year or 2010 compliant vehicles.*
22. Require the use of CARB certified particulate traps that meet level 3 requirements on all construction equipment.*
23. Utilize only CARB certified equipment for construction activities.*
24. The developer shall require all contractors to turn off all construction equipment and delivery vehicles when not in use and/or idling in excess of 3 minutes.*
25. Restrict engine size of construction equipment to the minimum practical size.*
26. Use electric construction equipment where technically feasible.*
27. Substitute gasoline-powered for diesel-powered construction equipment.*
28. Require use of alternatively fueled construction equipment, using, e.g., compressed natural gas, liquefied natural gas, propane, or biodiesel.*
29. Use methanol-fueled pile drivers.*
30. Install catalytic converters on gasoline-powered equipment.*
31. Require the use of Alternative Diesel Fuels on diesel equipment used. Alternative diesel fuels exist that achieve PM10 and NOx reductions. PuriNOx is an alternative diesel

formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NOx and a 63% reduction in PM10 compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.

32. Electrical powered equipment shall be utilized in-lieu of gasoline-powered engines where technically feasible.*
33. All forklifts shall be electric or natural gas powered.*
34. Suspend use of all construction equipment operations during second stage smog alerts.*
35. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.*
36. Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site.*
37. Reroute construction trucks away from congested streets and sensitive receptor areas.*
38. Configure construction parking to minimize traffic interference.*
39. Prior to the issuance of a grading and building permit, the applicant shall submit verification that a ridesharing program for the construction crew has been encouraged and will be supported by the contractor via incentives or other inducements.*
40. Minimize construction worker trips by requiring carpooling and providing for lunch onsite. *
41. Provide shuttle service to food service establishments/commercial areas for the construction crew.*
42. Provide shuttle service to transit stations/multimodal centers for the construction crew.*
43. Require the use of Zero-VOC paints, coatings, and solvents.

(* Would reduce impacts to GHGs as well) 34

Mitigation measure (MM) 4.2.6.1B is uncertain and vague, requiring that contractors "utilize power sources…" This should be amended to read that contractors shall utilize electricity from power poles rather than temporary diesel or gasoline power generators. It is further unclear what is considered to be a "clean-fuel." 35

MM 4.2.6.1C requires that, during construction, contractors utilize Tier II equipment. This measure does not go far enough. At least Tier III equipment is feasible and must be required where such equipment is available. 36

MM 4.2.6.1K does not require any mitigation, only that "construction specifications and bid documents" include "notations." This language must specify that: "the following mitigation shall be required to be implanted and, to ensure implementation, included in grading plans, construction specifications, and bid documents…" Several of the mitigation measures recommended above are included in this section but are not required of the project due to this language. 37

MM 4.2.6.3A does not go far enough. The EIR does not demonstrate that implementation of all of the design features mentioned would be infeasible. Each of these measures must be required. 38

Furthermore, it is misleading. Title 24 deals with building energy efficiency, so SmartWay partnerships and other mitigation measures concerning mobile emissions and vehicle standards will not be required to be implemented. ***As most of this project's operational emissions will be derived from mobile sources, and no mitigation measures pertain to reducing these emissions, the mitigation required of this project does not incorporate all feasible mitigation***. The measures under the bullet "Lease purchase documents shall identify that tenants are encouraged to promote the following" should simply be *required* mitigation for the project unless shown to be infeasible. 39

Operational Emissions 40

Impact 4.2.6.3 is unclear.

The Operational Emissions generated by this project are substantial. For instance, the project's NOX emissions will be 990 lbs/day, 18 times the threshold of significance of a 55lb/day increase; CO emissions will well exceed the threshold of significance at 830 lbs/day, one and a half times the threshold of significance of 550; ROG emissions of 143 lbs/day are 2.6 times the 55 lb threshold, and PM10 well exceeds the 150lbs/day threshold at 170lbs/day. (Note: the rounding of emissions downward where such totals are, for instance, 990.93 for NOx, but this number is rounded down to 990, fails to disseminate the *maximum* daily emissions caused by this project.) 41

The mitigation measures adopted to reduce operational emissions fail to reduce mobile emissions, by far the main source of this project's operational emission. (*See,* Table 4.2.K) The project's non-mobile source operational emissions are essentially limited to ROG emissions, yet the mitigation measures focus on the energy efficiency of the building. (e.g. MM 4.2.6.3A) 42

MM 4.2.6.3A does not go far enough and is misleading. All this mitigation measure requires is that the project's building energy efficiency exceed Title 24 by 20 percent. This mitigation does not in any way require the implementation of each of the alternatives listed below. Moreover, as Title 24 deals with building energy efficiency, SmartWay partnerships and other mitigation measures concerning mobile emissions and vehicle standards **will not be required to be implemented in order to satisfy the actual requirement of this mitigation**. The listing of alternatives to satisfy this mitigation measure is misleading and causes the EIR to fail as an informational document. 43

The EIR does not demonstrate that requiring that the project implement each of the alternatives listed at MM 4.2.6.3A is infeasible. Each of these alternatives must be required of the project. 44

With regards to operational mobile source emissions, most of this project's operational emissions will be derived from mobile sources, and no mitigation measures directly pertain to reducing these emissions. ***The mitigation required of this project to reduce operational air quality impacts does not incorporate all feasible mitigation*** as it fails to require the mitigation listed at MM 4.2.6.3A under the bullet "Lease purchase documents shall identify that tenants are encouraged to promote the following" yet does not find such mitigation to be infeasible. These measures must simply be *required* mitigation for the project as these measures will actually 45

reduce the project's mobile source operational emissions. Likewise, as discussed above, each of the other alternatives listed at MM4.2.6.3 is feasible and must be required of this project.

The following mitigation measures are feasible and must be required of this project:

1. The operator of the primary facilities shall become SmartWay Partner.*
2. The Project shall meet SmartWay 1.25 ratings.*
3. The project shall use only freight companies that meet SmartWay 1.25 ratings.*
4. (ALTERNATIVELY from 2,3 above) The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*
5. The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve a 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidator trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.*
6. All fleet vehicles shall conform to 2010 air quality standards or better. Results, including backup data shall be reported to the Planning Department semi-annually.*
7. All spaces utilizing refrigerated storage, including restaurants and food or beverage stores, shall provide an electrical hookup for refrigeration units on delivery trucks. Trucks incapable of utilizing the electrical hookup for powering refrigeration units shall be prohibited from accessing the site. All leasing documents shall include these requirements and provide that violation of those provisions will constitute a material breach of the lease that will result in the termination of the lease. Because of the fact that these terms of the lease are designed to benefit the public, the public shall be considered to be a third party beneficiary with standing to enforce the requirements of the lease.* 45
8. Install catalytic converters on gasoline-powered equipment.*
9. Where diesel powered vehicles are necessary, require the use of alternative diesel fuels. Alternative diesel fuels exist that achieve PM10 and NOx reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NOx and a 63% reduction in PM10 compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.
10. Electrical powered equipment should be utilized in-lieu of gasoline-powered engines where technically feasible.*
11. Utilize electrical equipment for landscape maintenance.*
12. All forklifts shall be electric or natural gas powered.*
13. Utilize electric yard trucks.*
14. Prohibit idling of trucks for periods exceeding three minutes.*

Letter D

15. Provide electrical vehicle ("EV") and compressed natural gas ("CNG") vehicles in vehicle fleets.*
16. Charge reduced or no parking fee for EVs and CNG vehicles.*
17. Install EV charging facilities for a minimum of 10% of all parking spaces.*
18. Install a CNG fueling facility.*
19. Provide preferential parking locations for EVs and CNG vehicles.*
20. Implement parking fee for single-occupancy vehicle commuters.*
21. Plant shade trees in parking lots to provide minimum 50% cover to reduce evaporative emissions from parked vehicles.*
22. Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.*
23. Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.*
24. Orient 75 percent or more of homes and buildings to face either north or south (within 30 degrees of N/S) and plant trees and shrubs that shed their leaves in winter nearer to these structures to maximize shade to the building during the summer and allow sunlight to strike the building during the winter months.*
25. Provide grass paving, tree shading, or reflective surface for unshaded parking lot areas, driveways, or fire lanes that reduce standard black asphalt paving by 10% or more.*
26. Electrical outlets shall be installed on the exterior walls of all residential and commercial buildings (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.* 45
27. Prohibit gas powered landscape maintenance equipment within residential, commercial, and mixed-use developments. Require landscape maintenance companies to use battery powered or electric equipment **or** contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.*
28. Provide a complimentary cordless electric lawnmower to each residential buyer.
29. Implement parking cash-out program for non-driving employees.*
30. Require each user to establish a carpool/vanpool program.*
31. Create a car sharing program within the planned community.*
32. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.*
33. Provide preferential parking for carpool/vanpool vehicles.*
34. Provide subsidies or incentives to employees who use public transit or carpooling, including preferential parking.*
35. Provide secure, weather-protected bicycle parking for employees.*
36. Provide direct, safe, attractive pedestrian access from project to transit stops and adjacent development.*
37. Provide direct safe, direct bicycle access to adjacent bicycle routes.*
38. Provide showers and lockers for employees bicycling or walking to work.*
39. Short-term bicycle parking for retail customers and other non-commute trips.*
40. Connect bicycle lanes/paths to city-wide network.*
41. Design and locate buildings to facilitate transit access, e.g., locate building entrances near

transit stops, eliminate building setbacks, etc.*

42. Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc.*
43. Provide a display case or kiosk displaying transportation information in a prominent area accessible to employees or residents.
44. Provide shuttle service to food service establishments/commercial areas.*
45. Provide shuttle service to transit stations/multimodal centers.*
46. Provide on-site child care or contribute to off-site child care within walking distance.*
47. Implement a compressed workweek schedule.*
48. Implement home-based telecommunicating program, alternate work schedules, and satellite work centers.*
49. All buildings shall be constructed to LEED Platinum standards.*
50. Design buildings for passive heating and cooling and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.*
51. Construct photovoltaic solar or alternative renewable energy sources sufficient to provide 100% of all electrical usage for the entire Project.*
52. Install an ozone destruction catalyst on all air conditioning systems.*
53. Construct renewable energy sources sufficient to offset the equivalent of 100% of all greenhouse gas emissions from mobile sources (internal combustion engines) for the entire Project. *
54. Purchase only green/ renewable power from the electric company.*
55. Install solar water heating systems to generate all hot water requirements.*

45

Cumulative Impacts

The finding of less than significant short-term cumulative impacts is unsupported by evidence in the record. The EIR finds that project individual construction emissions will be significant, and that other projects construction simultaneously will result in short term pollutant impacts. However, the EIR then states that because each project will have to comply with SCAQMD measures such cumulative impact is less than significant. This conclusion is unsupported by the EIR or any reasoning. In fact, here compliance with SCAQMD measures did not reduce short-term air quality impacts below a level of significance, and the presumption that it would for other area projects and the cumulative impact is completely unsupported by any evidence.

The project will result in significant and unmitigated cumulative operational impacts, yet not all feasible mitigation was adopted to reduce this impact. As discussed above, additional mitigation measures must be implemented to reduce operational impacts.

46

Biological Resources

The EIR finds that impacts to biological resources will be less than significant with mitigation based on outdated and limited surveys. The EIR therefore fails as an informational document.

47

Cultural Resources

The EIR finds that impacts to cultural resources would be less than significant with mitigation with regards to paleontological resource or unique geologic feature. The project site has a "high

48

potential to contain significant fossil resources due to the presence of early to middle Pleistocene alluvial fan deposits." The finding of less than significant impacts with mitigation is unsupported as the mitigation required for this potentially significant impact is deficient and fails to incorporate all feasible mitigation. 48

First, MM Cul-1 provides for discontinuing monitoring if "the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached." This mitigation measure is impermissibly vague as it fails to state what portion of the site must be excavated to maximum depth before this determination of "no evidence" is made. 49

Second, a qualified paleontological monitor may only "salvage fossils" or temporarily halt or divert equipment to remove large specimens while avoiding construction delays. This salvage of fossils fails to account for the potential importance associated with the placement of those fossils across the site or any study or documentation of the specimens at the site. The salvaging will also likely result in the loss of many paleontological resources as the purpose of the mitigation is demonstrated by this method to be, primarily, to "avoid construction delays" and not to avoid damaging paleontological resources. 50

MM Cul-1 also uses the qualification: "If too few fossil remains are found…"; this is impermissibly vague. There is no quantification of "too few" or objective way to determine whether this has occurred. 51

Overall, the mitigation required for archaeological resources fails to reduce impacts below a level of significance through vagueness and inherent deficiencies. Salvaging fossils also fails to further Objective 7.6 of the General Plan to "Identify and preserve Moreno Valley's unique historical and archaeological resources for future generations." The mitigation and potential impacts conflict with Policy 7.6.1 and 7.6.2 will not ensure that the archaeological resources are preserved or mitigated. It is also unclear from the EIR whether Conservation Element Programs, General Plan 9.7.3, program 7-6 has been incorporated where such program requires: "In areas where archaeological or paleontological resources are known or reasonably expected to exist, based upon the citywide survey conducted by the UCR Archaeological Research Unit, incorporate the recommendations and determinations of that report to reduce potential impacts to levels of insignificance." The EIR therefore fails to require all feasible mitigation, ensure enforceable mitigation, and fails as an informational document. 52

Geology and Soils

The project will require excavation, fill, and recompaction. The project description states that approximately 220,000 cubic yards of additional fill will be required. It is unclear whether the EIR considered impacts from the import of fill, such as traffic and air quality impacts from truck trips to and from the project site to the fill import site, an unknown location at this time. Some 80,000 cy of fill has already been imported to the site, yet the impacts from this fill dirt have 53

been segregated from the remainder for the project. Again, project impacts have been underestimated and improperly segmented. 53

The project is also located on a geologic unit or soil that is unstable as soil shrinkage and expansion may occur. The mitigation for expansive soils, MM Geo-2 is deferred and vague. Specifically, such mitigation requires that the project proponent "inform" engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the geotechnical analysis and that such guidelines "shall be reviewed and considered." The guidelines must be required of the project in order for such mitigation to certain and enforceable. 54

GHGs

The EIR finds that the project is consistent with GHG plans, policies, and regulations. The reasoning behind several of these findings is unsupported. For instance with regards to transportation, as discussed above, the project is unlikely does not reduce VMT. 55

Compliance with GHG reduction strategies is also unsupported. For instance, the EIR fails to delineate how an energy efficient building features support achieving a 33 percent renewable energy mix statewide, unless the building will be reliant on renewable energy. Similarly, the EIR fails to show how the project is compliant with engine efficiency measures where the project does not require the use of fuel efficient trucks. 56

There is no GHG reduction plan as part of the City of Moreno Valley's General Plan, hence Tier 2 SCAQMD criteria are improperly applied. Tier 2 criteria is intended for a plan that may be part of a local general plan, for example. Comparing the impacts from this project to statewide emissions in order to find such emissions to be less than significant is improper.

Tier 3 is more properly applied to the industrial project at hand. The screening level for Tier 3 per the December 5, 2008 the SCAQMD Governing Board adoption of interim GHG significance thresholds is less than 10,000 MTCO2eq/yr. CARB's threshold for the same is less than 7,000MTCO2eq/yr and meets construction and transportation performance standards. Applying these interim thresholds to this project, the project is far in exceedence with emissions in the range of 44,000 MTCO2eq/yr. The finding that the project will have a less than significant individual impact on GHGs and climate change is unsupported in light of the interim numerical thresholds established for industrial projects by SCAQMD and ARB, and these omissions cause the EIR to fail as an informational document. Notably, the GHG appendix E delineates these standards at page 22 (from 2010), but they are neither applied nor mentioned in the EIR. 57

The mitigation measure requiring the devising of a comprehensive water conservation strategy is vague and defers mitigation. There is no requirement that the alternatives listed be incorporated 58

or that the conservation strategy meet any performance standards. 58

Mitigation measure 4.3.6.1A is not mitigation, but a requirement of the California Code of Regulations. 59

Notwithstanding the above deficiencies, the EIR finds cumulative GHG impacts of the project to be significant and unavoidable. 60

Hazards and HazMat

The EIR finds, based on no substantial evidence, that this impact is less than significant. The EIR explains that "potentially hazardous materials…may be used and/or stored on site during the construction and/or occupancy of the proposed industrial facilities." As the tenant of the proposed industrial building is unknown, this impact should be considered potentially significant. Compliance with applicable laws does not necessarily reduce this impact below a level of significance. 61

Hydrology and Water Quality

The project will have a significant impact to water quality which will be mitigated below a level of significance, yet the EIR fails to undertake an evaluation of this impact beyond the cursory review done for the Environmental Assessment. 62

The project will alter the existing drainage onsite. Mitigation Measure Hyd-05 improperly defers mitigation as the EIR fails to provide any reason why the grading plan and/or drainage report cannot be presently prepared but, instead, must be deferred. Deferred mitigation is only permissible where, for practical reasons, it is not feasible to prescribe specific mitigation measures in the EIR. (*Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 94.) This caveat is not demonstrated here, and a grading plan and drainage report must be contemporaneously prepared for the EIR. 63

Land Use

The project will conflict with an applicable habitat conservation plan or natural community conservation plan. It is unclear how MM Bio-1 through MM Bio-4 will reduce this impact below a level of significance. The EIR thereby fails as an informational document and impacts to land use should be considered significant and unmitigated. 64

Noise

The EIR arbitrarily creates a threshold for significance for noise of a 3dbA increase, stating that only this level of increase is considered potentially significant and that a 3 dbA change is used as a threshold of significance. This 3dbA change is ***not*** a threshold of significance adopted by the City of Moreno Valley. (Guidelines § 15064.7) Furthermore, the statement that only audible 65

changes in existing ambient or background noise levels are considered potentially significant is unsupported except by further conclusory statements. 65

The EIR also relies on the City's Municipal Code with regards to prohibited acts and noise disturbances. These figures too are not a threshold of significance and are not noise standards adopted by the City. Rather, they represent punishable acts and violations of the law. Exemptions from sound regulations likewise refer to punishable sound violations and not noise standards adopted by the City. 66

The noise standards adopted by the City are described in the General Plan, Section 6.4, which states that acceptable residential exterior noise standards are within 60-65 CNEL, and interior at 45 dbA CNEL. The City's municipal code sets limits for a noise disturbance as well at the limits of Table 4.4.F, at Residential 60 dBA daytime, 55 dBA nighttime; Commercial 65 dBA daytime, 60dBA nighttime. 67

The EIR states that the noise analysis was done using "the soft site propagation for noise" on the basis that the ground is not pavement in the project vicinity. However, the site itself will be paved, in addition to the roads that vehicles will travel to and from the site. Other uses surrounding the site are also paved and include industrial/warehouse uses to the north, industrial/warehouse and undeveloped property to the south, industrial/warehouse and a self-storage facility to the east, and warehouses, vehicle storage, residences, and undeveloped property to the west. While these uses are interspersed with vacant uses, agricultural and undeveloped land in the project vicinity is zoned for development and will be hastened towards that end through the development of this project and surrounding areas. Overall, the use of soft site analysis is unsupported by the EIR, and noise levels are likely to be much higher than those predicted by the EIR. 68

The noise study relies on a standard vehicle mix to determine traffic noise. This is unsupported given the locale and proposed project use as a distribution facility. 69

The EIR find that the project will increase traffic noise at 5 study roadway segments where four of these segments already exceed the level of significance for noise. This must be considered a significant impact as the project will result in an increase in ambient noise and such noise levels are and will be unacceptable at off-site land uses. 70

The project will also cause exposure and generation of noise levels in excess of General Plan and Municipal Code standards for construction and operation noise. The EIR wrongly looks at noise impacts at the nearest residence, where the proper measure is to look at noise generation at the property line. 71

The EIR concludes that loading and unloading will be "intermittent" and therefore less than significant. However, the warehouse will be a distribution warehouse, with trucks coming and 72

going, loading and unloading throughout the day. Accordingly, as noise levels will be 75 dBA at 50 feet, the noise impact is significant. 72

The EIR finds long-term traffic and operational noise impacts to be less than significant. However, the entire discussion in the EIR regarding noise is very conclusory and fails to provide any sources for the figures relied upon. 73

The Construction noise analysis is fatally flawed, as the source for typical construction equipment noise is quite outdated, from 1987. It is impossible that construction noise sources from 1987 have not been altered in 25 years. The EIR fails as an informational document by failing to rely on contemporary studies and data. The noise exposure during construction will be much greater than predicted by the EIR. (*See,* attached "Construction Noise Handbook," Chapters 3, 4, and 9, Federal Highway Administration, August 2006, <http://www.fhwa.dot.gov/environment/noise/construction_noise/handbook/index.cfm>; and" Construction Noise: Exposure, Effects, and the Potential for Remediation; A Review and Analysis," Electronic Library of Construction Occupational Safety and Health, November/December 2002.) Nonetheless, the EIR concludes that noise levels during construction will be up to 91 dBA at 50 feet. 74

The project will have a significant impact from construction noise that is said to be mitigated below a level of significance. However, as discussed above, such mitigation may not be sufficient after analysis based on contemporary studies. Furthermore, the EIR relies on noise occurring between the hours required by the City. This is not mitigation but the law. 75

As it is uncertain that mitigation will reduce project impacts below a level of significance, the following additional mitigation must be required of the project: 76

1. Temporary noise barriers must be installed during project construction.
2. Where technically feasible, utilize only electrical construction equipment
3. During construction, the developer shall require that all contractors turn off all construction equipment and delivery vehicles when not in use and prohibit idling in excess of 3 minutes.
4. Provide a "windows closed" condition requiring a means of mechanical ventilation (e.g. air conditioning) for all buildings.
5. Provide upgraded windows with a minimum Sound Transmission Class (STC) rating of 34 for all buildings, and/or require the installation of double-paned windows.
6. Keep new transportation facilities away from vibration sensitive areas.
7. When dealing with existing transportation facilities, obvious vibration causes, such as pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc., may be eliminated by resurfacing.
8. Require the use of rubberized asphalt for construction of all roadways and parking areas.
9. Maintain quality pavement conditions that are free of bumps, pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc.
10. Require resurfacing of roads.

11. Ban heavy trucks near vibration sensitive uses.
12. Use alternate construction methods and tools to reduce construction vibrations. Examples are predrilling of pile holes, avoiding cracking and seating methods for resurfacing concrete pavements near vibration sensitive areas, using rubber tired as opposed to tracked vehicles, placing haul roads away from vibration sensitive areas. 76
13. Scheduling construction activities (particularly pile driving) for times when it does not interfere with vibration sensitive operations (e.g. night time).

Mitigation Measure 4.9.6.1D does not mitigate for noise impacts during construction hours. 77

Cumulative noise impacts were found to be "No Impact." This conclusion is unsupported. The discussion of cumulative traffic noise impacts is unsupported. 78

Transportation

Traffic counts from the project are low given the project's 264 dock doors, parking for 368 trucks and trailers, and parking for 589 passenger vehicles. 79

The EIR fails to study many intersections that will be impacted by the project, particularly along Harley Knox Boulevard en route to I-215. Also, no freeway connection to the north was evaluated at Cactus, and no evaluation of impacts to the south to the Ramona Expressway was conducted. The EIR fails as an informational document by failing to study impacts to these intersections. The EIR also fails to look at future traffic impacts. 80

The EIR attempts to minimize the project's significant and unmitigated traffic impacts by segregating impacts to existing versus 2013 and local intersections and roadways versus freeway segments. 81

The project will result in significant and unmitigated cumulative traffic impacts, resulting in less 10 intersections and 4 roadway segments operating as below the City's LOS standard. Additionally, 3 freeway segments and ramp merge/diverge areas would operate at unsatisfactory levels of service. Despite these impacts, the project does not require any additional mitigation at these intersections or roadways beyond contribution to the DIF and TUMF. 82

The EIR finds that impacts to intersections and roadway segments within the DIF and TUMF programs will be reduced below a level of significance despite the fact that many of these improvements are not yet funded and will likely not be funded for some time. Mitigation is therefore uncertain and deferred. It appears that the only improvement currently planned is widening of Perris Boulevard, to be completed in May 2013. Nonetheless, the EIR finds that impacts based on Opening year 2013 plus project will be mitigated to less than significant at all significantly impacted roadway segments and intersections other than the I-215 segments and ramps. The fact that an improvement is part of the DIF or TUMF program does not ensure that it will soon be planned or funded, and surely does not ensure that it will be planned, funded, and 83

built by 2013 to reduce impacts to less than significant. 83

In fact, the roadways reliant on TUMF funds are not presently scheduled for improvement nor are the improvements funded. (*See, e.g., 2011 Annual Report, Transportation Uniform Mitigation Fee Program,* Western Riverside Council of Governments, "Five Year Transportation Improvement Program," <http://www.wrcog.cog.ca.us/downloads/AnnualReport_for_web.pdf>, p.39, *See, also,* <http://www.wrcog.cog.ca.us/downloads/2012CentralZoneTIP020612.pdf> [detailing funded expenditures in the Central Zone]) Furthermore, TUMF improvements can take up to 9 years to become a reality from a local jurisdiction developing a project to completion of construction. (*2011 Annual Report, Transportation Uniform Mitigation Fee Program, supra,* p.7) Project prioritization, programming, and allocation of funds may also be a barrier to improvements on the roadways impacted by this project. (*2011 Annual Report, Transportation Uniform Mitigation Fee Program, supra,* p.10) The EIR's conclusion that project transportation impacts on local roadways and intersections is less than significant after mitigation is simply not supported by evidence and the realities of these fair share programs. 84

With regards to DIF funding, the EIR even states that, "As part of its Capital Improvement program, the City determines the timing of necessary roadway improvements based on periodic review of citywide traffic counts, traffic trends, and a review of traffic accidents." The finding of less than significant impact after mitigation at these impacted intersections and roadway segments is therefore unsupported as such reduction to a level below significance may not occur in the short-term, long-term, or ever if these roadways are not given priority. 85

Mitigation requiring direct funding and completion of improvements at impacted roadways and intersections must be required of the project unless demonstrated to be infeasible. As the project currently stands, not all feasible mitigation has been required of this project to reduce traffic related impacts below a level of significance, and mitigation is uncertain and deferred. 86

Consistency with Local and Regional Plans

The EIR finds that the project is consistent with the SCAQMD AQMP, however the EIR previously found that the project failed to meet SCAQMD's requirements with regard to air quality control for mobile sources and construction emissions. 87

Consistency with the Transportation chapter of the 2008 RCP is unsupported. The statement that the proposed project will "limit[] the need for vehicle travel" and therefore satisfy the goal of "A more efficient transportation system that reduces and better manages vehicle activity" is erroneous. As discussed above, the project will have significant and unmitigated traffic impacts, and reliance on the TUMF and DIF programs provides for uncertain mitigation for traffic impacts. 88

Consistency with the Economy Chapter is likewise unsupported by the EIR. The Goal of 89

"diversifying the region's economy" is not satisfied by "add[ing] to the City's portfolio of industrial services." Said another way, the project will add more industrial services to already existing/proposed industrial services, the opposite of diversifying the region's economy. 89

The EIR finds that the project is consistent with the Compass Growth Vision Principles, yet fails to evaluate how the project is consistent with these principles. The evaluation provides is generalized and fails to discuss how the project is, in fact, consistent with principles 1, 2, and 4 re: improving mobility, fostering livability, and promoting sustainability for future generations. The finding of inconsistency is unsupported by the EIR and, again, the EIR fails as an informational document. 90

Segmentation

The project site has already received 80,000 cubic yards of fill of the total 300,000 cubic yards required onsite. The impact from this fill importation was segmented from the project as a whole. Such importation, upon evaluation in the EIR, would likely push the project construction impacts further above several threshold of significance and would likely lead to the exceedance of PM2.5, among perhaps others. 91

Alternatives

Where there is an environmentally superior alternative that significantly decreases the significant impacts of the Project then that alternative must be approved rather than the Project if that alternative is feasible, even if the alternative would impede to some degree the attainment of the project objectives, or would be more costly. [(PRC§ 21002; *Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 597, State CEQA Guidelines § 15126.6(b)]

In this case, both the no project alternative and the reduced intensity alternative would reduce impacts when compared with the project. The reduced intensity alternative would reduce several impacts below a threshold of significance when compared to the proposed project. The reduced intensity alternative would also satisfy most of the project objectives. Accordingly the reduced intensity alternative must be approved over the project. 92

The EIR undermines the reduced intensity alternative by claiming that impacts would be similar; this claim is entirely unsupported by the facts and figures provided in comparison. For instance, with regards to traffic impacts, the EIR finds that impacts to roadways and intersections would be reduces. The EIR then, however, finds that the impact "would be similar." The EIR also finds that the reduced intensity alternative fails to satisfy several project objectives; these findings are likewise unsupported by the evidence. For instance, the EIR states that the reduced intensity alternative fails to meet the objective of clustering industrial warehouses near efficient access points. However, the reduced intensity alternative does not move the project. Nonetheless, the reduced intensity alternative substantially reduces impacts and meets most 93 94 95

project objectives. Accordingly, it must be approved rather than the project. 95

Lastly, the final line of the environmentally superior alternative pertains to an alternative site. There is no discussion of an alternative site with regards to the reduced intensity alternative. The EIR is misleading and fails as an informational document by claiming that the reduced intensity alternative fails to meet objectives related to location because of an alternative site. 96

Conclusion

Thank you for your consideration of these comments and the attached and/or referenced material.

Sincerely,

Raymond W. Johnson

Johnson & Sedlack, an Environmental Law firm representing plaintiff environmental groups in environmental law litigation, primarily CEQA.

City Planning:

Current Planning

- Two years principal planner, Lenexa, Kansas (consulting)
- Two and one half years principal planner, Lee's Summit, Missouri
- One year North Desert Regional Team, San Bernardino County
- Thirty years subdivision design: residential, commercial and industrial
- Thirty years as applicants representative in various jurisdictions in: Missouri, Texas, Florida, Georgia, Illinois, Wisconsin, Kansas and California
- Twelve years as applicants representative in the telecommunications field

97

General Plan

- Developed a policy oriented Comprehensive Plan for the City of Lenexa, Kansas.
- Updated Comprehensive Plan for the City of Lee's Summit, Missouri.
- Created innovative zoning ordinance for Lenexa, Kansas.
- Developed Draft Hillside Development Standards, San Bernardino County, CA.
- Developed Draft Grading Standards, San Bernardino County.
- Developed Draft Fiscal Impact Analysis, San Bernardino County

Environmental Analysis

- Two years, Environmental Team, San Bernardino County
  - Review and supervision of preparation of EIR's and joint EIR/EIS's
  - Preparation of Negative Declarations
  - Environmental review of proposed projects
- Eighteen years as an environmental consultant reviewing environmental documentation for plaintiffs in CEQA and NEPA litigation

Representation:

- Represented various clients in litigation primarily in the fields of Environmental and Election law. Clients include:
  - Sierra Club
  - San Bernardino Valley Audubon Society
  - Sea & Sage Audubon Society
  - San Bernardino County Audubon Society

Johnson & Sedlack, Attorneys at Law
26785 Camino Seco 12/97- Present
Temecula, CA 92590
(951) 506-9925

Principal in the environmental law firm of Johnson & Sedlack. Primary areas of practice are environmental and election law. Have provided representation to the Sierra Club, Audubon Society, AT&T Wireless, Endangered Habitats League, Center for Community Action and Environmental Justice, California Native Plant Society and numerous local environmental groups. Primary practice is writ of mandate under the California Environmental Quality Act.

Planning-Environmental Solutions
26785 Camino Seco 8/94- Present
Temecula, CA 92590
(909) 506-9825

Served as applicant's representative for planning issues to the telecommunications industry. Secured government entitlements for cell sites. Provided applicant's representative services to private developers of residential projects. Provided design services for private residential development projects. Provided project management of all technical consultants on private developments including traffic, geotechnical, survey, engineering, environmental, hydrogeological, hydrologic, landscape architectural, golf course design and fire consultants. 97

San Bernardino County Planning Department
Environmental Team 6/91-8/94
385 N. Arrowhead
San Bernardino, CA 92415
(909) 387-4099

Responsible for coordination of production of EIR's and joint EIR/EIS's for numerous projects in the county. Prepared environmental documents for numerous projects within the county. Prepared environmental determinations and environmental review for projects within the county.

San Bernardino County Planning Department
General Plan Team 6/91-6/92
385 N. Arrowhead
San Bernardino, CA 92415
(909) 387-4099

Created draft grading ordinance, hillside development standards, water efficient landscaping ordinance, multi-family development standards, revised planned development section and fiscal impact analysis. Completed land use plans and general plan amendment for approximately 250 square miles. Prepared proposal for specific plan for the Oak Hills community.

San Bernardino County Planning Department
North Desert Regional Planning Team
15505 Civic 6/90-6/91
Victorville, CA
(619) 243-8245

Worked on regional team. Reviewed general plan amendments, tentative tracts, parcel maps and conditional use permits. Prepared CEQA documents for projects.

Broadmoor Associates/Johnson Consulting
229 NW Blue Parkway
Lee's Summit, MO 64063
(816) 525-6640 2/86-6/90

Sold and leased commercial and industrial properties. Designed and developed an executive office park and an industrial park in Lee's Summit, Mo. Designed two additional industrial parks and residential subdivisions. Prepared study to determine target industries for the industrial parks. Prepared applications for tax increment financing district and grants under Economic Development Action Grant program. Prepared input/output analysis of proposed race track Provided conceptual design of 800 acre mixed use development.

Shepherd Realty Co. 97
Lee's Summit, MO 6/84-2-86

Sold and leased commercial and industrial properties. Performed investment analysis on properties. Provided planning consulting in subdivision design and rezoning.

Contemporary Concepts Inc.
Lee's Summit, MO 9/78-5/84
Owner

Designed and developed residential subdivision in Lee's Summit, Mo. Supervised all construction trades involved in the development process and the building of homes.

Environmental Design Association
Lee's Summit, Mo.
Project Coordinator 6/77-9/78

Was responsible for site design and preliminary building design for retirement villages in Missouri, Texas and Florida. Was responsible for preparing feasibility studies of possible conversion projects. Was in charge of working with local governments on zoning issues and any problems that might arise with projects. Coordinated work of local architects on projects. Worked with marketing staff regarding design changes needed or contemplated.

City of Lee's Summit, MO
220 SW Main
Lee's Summit, MO 64063
Community Development Director 4/75-6/77

Supervised Community Development Dept. staff. Responsible for preparation of departmental budget and C.D.B.G. budget. Administered Community Development Block Grant program. Developed initial Downtown redevelopment plan with funding from block grant funds. Served as a member of the Lee's Summit Economic Development Committee and provided staff support to them. Prepared study of available industrial sites within the City of Lee's Summit. In charge of all planning and zoning matters for the city including comprehensive plan.

Howard Needles Tammen & Bergendoff
9200 Ward Parkway
Kansas City, MO 64114
(816) 333-4800 5/73-4/75
Economist/Planner

Responsible for conducting economic and planning studies for Public and private sector clients. Consulting City Planner for Lenexa, KS.

Conducted environmental impact study on maintaining varying channel depth of the Columbia River including an input/output analysis. Environmental impact studies of dredging the Mississippi River. Worked on the Johnson County Industrial Airport industrial park master plan including a study on the demand for industrial land and the development of target industries based upon location analysis. Worked on various airport master plans. Developed policy oriented comprehensive plan for the City of Lenexa, KS. Developed innovative zoning ordinance heavily dependent upon performance standards for the City of Lenexa, KS.

97

2.10 RESPONSE TO LETTER D

Johnson & Sedlack

Response to Comment D-1. The commentor has accurately summarized the general aspects of the proposed project. No further response is necessary.

Response to Comment D-2. The City agrees that the major tenent of CEQA is that it is a disclosure process; therefore, your letter along with all the other comments and responses will be forwarded to the City decision makers for their consideration in the review of the EIR. No further response is necessary.

Response to Comment D-3. The commentor's opinions on the quality of the environmental assessment that was done will be forwarded to the decision-makers for their consideration. The City disagrees with the commentor's generalized assertions regarding the adequacy of the VIP Moreno Valley Draft EIR. The comment that the conclusions in the EIR are not based in fact is erroneous. The Draft EIR is based on the findings of technical studies that were prepared for the project that were included in their entirety in the appendices to the Draft EIR. Those studies are:

- General Habitat Assessment, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California, Ecological Sciences, Inc., August 1, 2010.
- Jurisdictional Survey and MSHCP Riparian/Riverine/Vernal Pools Evaluation, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California, Ecological Sciences, Inc., November 1, 2009.
- Focused Surveys for Selected Criteria Area and Narrow Endemic Plant Species, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California, Ecological Sciences, Inc., November 9, 2009.
- Focused Western Burrowing Owl Survey, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California, Ecological Sciences, Inc., November 11, 2009.
- Phase I Cultural Resources Assessment and Paleontological Records Review Perris Boulevard Project, Moreno Valley, Riverside County, California, Michael Brandman Associates, March 22, 2007.
- Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007.
- Phase I Environmental for the Evaluation of Potentially Hazardous Materials, Centec Engineering, February 23, 2007.
- Preliminary Hydrology Report and Hydraulic Analysis for PA09-004, VIP Moreno Valley, SWC Perris Boulevard and Grove View Road, Robert A. Bebensee, R.C.E., March 27, 2009.
- Preliminary Water Quality Management Plan, for PA09-0004 VIP Moreno Valley, SWC Perris Boulevard and Grove View Road, Robert A. Bebensee, R.C.E., July 24, 2009.
- Water Supply Assessment for City of Moreno Valley Plot Plan Application PA09-004, Eastern Municipal Water District, January 20, 2010.
- LESA Modeling Worksheets, LSA Associates, Inc., August 2011.
- Air Quality Analysis VIP Moreno Valley, LSA Associates, Inc., March 2012.
- Health Risk Assessment VIP Moreno Valley, LSA Associates, Inc., March 2012.

MV00170188

- Greenhouse Gas Emissions and Global Climate Change Study, LSA Associates, Inc., December 2011.
- Noise Impact Analysis VIP Moreno Valley, LSA Associates, Inc., March 2012.
- Traffic Study VIP Moreno Valley, LSA Associates, Inc., April 9, 2012.

The Initial Study that was prepared for the proposed project determined that impacts on biological resources, cultural resources, geology, and hydrology and water quality would be less than significant with the implementation of mitigation not potentially significant requiring further analysis in an EIR. Those specific mitigation measures are identified in the Initial Study, Section 2.0 of the EIR and are also included in the Mitigation Monitoring and Reporting Plan (MMRP) attached to the Final EIR. The City formally initiated the environmental process with circulation of an NOP along with the Initial Study , which it sent to responsible agencies and interested individuals for a 30-day review period from August 26 to September 26, 2011. At the close of the public review period, the City had received 12 letters on the NOP. The NOP disclosed that an EIR would be prepared and the issues that would be addressed are agricultural and forest resources, air quality, greenhouse gases and global climate change, noise and transportation. None of the responses to the NOP asked that biological resources, cultural resources, geology, and hydrology and water quality be evaluated in the EIR. As a result the City is not concealing information from the public on the significance of impacts.

Response to Comment D-4. The City respectfully disagrees with the commentor's opinion that the findings in the EIR are not supported by substantial evidence. (also refer to Response to Comment D-3).

Response to Comment D-5. As appropriate, a portion of the mitigation measures suggested by the commentor (refer to Response to Comment D-45) have been incorporated in the Final EIR to further reduce impacts but these mitigation measures do not change the conclusions or analysis in the Draft EIR. All mitigation measures that are in the Draft EIR and mitigation added as a result of responses to D-45, D-34 and E-51 through D– 53 have been included in the MMRP (Section 4.0 of the Final EIR) to ensure that they are being implemented.

Response to Comment D-6. It is the commentor's opinion that the mitigation measures in the EIR are vague, uncertain, and unenforceable and are not based in fact nor does the commentor provide any examples. As detailed in the following responses, appropriate and enforceable mitigation of the project's significant individual and cumulative impacts have been identified in the Draft EIR.

Response to Comment D-7. It is not clear as to what the commentor is referring to in stating "several "alternatives" listed in the EIR will not satisfy the actual mitigation required, while other mitigation measures merely require the incorporation of writings, not actions."

The alternatives (Section 6.0 of the Draft EIR) are in compliance with *CEQA Guidelines* Section 15126.6(a), where the Draft EIR describes "a range of reasonable alternatives to the project, or to the location of the project which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project." The EIR need not consider every conceivable alternative; rather it must consider a reasonable range of potentially feasible alternatives to the project, or to the location of the project, which would avoid or substantially lessen significant effects of the project, even if "these alternatives would impede to some degree the attainment of the project objectives, or would be more costly" (*CEQA Guidelines* Section 15126.6(b)). The discussion of project alternatives must "include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project." The alternatives are to "substantially lessen the significant effects of the project", not to satisfy the actual mitigation required.

It is not clear by what the commentor means as to the mitigation measures "merely require incorporation of writings" and no examples were provided by the commentor to clarify the meaning of the statement.

Response to Comment D-8. The commentor inaccurately suggests that the project should be required to obtain a LEED gold or platinum rating as a form of mitigation of significant impacts associated with air pollution and greenhouse gas emissions impacts. The process of obtaining a LEED rating of any level (LEED ratings levels are Certified, Silver, Gold, and Platinum, with Platinum being the highest) is not mitigation. However, the specific green building features that are part of the LEED rating equation can reduce air pollution and greenhouse gas emissions impacts by minimizing and reducing the quantity of emissions. Mitigation Measure 4.2.6.3.A in the Draft EIR prescribes a performance standard requiring a 20% improvement in energy efficiency (over and above the 2008 CBC) for the building and lists suggested measures that can be included in the building's design to obtain this improvement in energy efficiency. As stated in Mitigation Measure 4.2.6.3.A (Draft EIR page 4.2-26): *"Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:"* With implementation of this measure, the building will meet the 20% performance standard which will render greenhouse gas emissions impacts to a less than significant level on a project-specific basis.

Regarding air quality impacts, many of the suggested mitigation measures have been added in the Final EIR, are incorporated in the Draft EIR already, or were determined to be infeasible. For a list of those mitigation measures please refer to the Tables contained in Response to Comments D-34 regarding construction mitigation measures and D-45 regarding operational mitigation measures.

For clarification purposes, the Level of Significance After Mitigation conclusion regarding the project-specific impact associated with climate change and greenhouse gas emissions that appears on page 4.3-26 has been modified as shown below and as indicated in Section 3.0 Errata in the Final EIR:

Draft EIR, Section 4.3.6.1 Greenhouse Gas Emissions, Page 4.3-26

> **Level of Significance After Mitigation.** The mitigation measures identified above would contribute to a reduction in GHG emissions from energy, mobile, and water usage sources. With implementation of the identified mitigation measures, the proposed project's GHG emissions are reduced. As described above, project-related GHG emissions are not confined to a particular air basin but are dispersed worldwide. Consequently, it is speculative to determine how project-related GHG emissions would contribute to global climate change and how global climate change may impact the State. Therefore, project-related GHG emissions are not project-specific impacts to global warming but are instead the project's contribution to this cumulative impact. As stated previously, project-related GHG emissions and their contribution to global climate change impacts in the State are less than significant ~~and less than cumulatively considerable~~ on a project specific basis because: (1) the project's impacts alone would not cause or significantly contribute to global climate change, and (2) the project has no substantial effect on consumption of fuels or other energy resources, especially fossil fuels that contribute to GHG emissions when consumed. However, project-related GHG emissions and their contribution to global climate change impacts are considered to be cumulatively considerable.

Response to Comment D-9. Please see Response to Comment D-8. In addition, a portion of the air quality mitigation measures suggested by the commentor have been incorporated to further reduce air quality and impacts. Please refer to the Table contained in Response to Comment D-45. However, these mitigation measures do not change the conclusions or analysis in the Draft EIR.

Response to Comment D-10. The commentor incorrectly asserts that the project's traffic impacts are not fully mitigated through contribution to TUMF and DIF. As elaborated in Responses to Comments D-82 through D-85, the project's payment of these fees will result in full and complete mitigation.

Response to Comment D-11. The commentor incorrectly asserts that the environmentally superior alternative meets most project objectives and must be approved instead of the proposed project. Although the environmentally superior alternative (reduced density) will result in reduced air pollution and GHG emissions, impacts associated with these issues would remain significant and unavoidable for air quality, greenhouse gas emissions, and traffic in the same manner as the proposed project (see Draft EIR Section 6.4 Comparison of Project Alternatives, Table 6.K, page 6-31). Also refer to Responses to Comments D-92 through D-95 for further elaboration on this subject.

Response to Comment D-12. While the Draft EIR does acknowledge that "*Development of the project site would introduce a new source of light and glare into the area in the form of street lighting, parking lot lighting, and security lighting for the buildings*" the Draft EIR does not state that the project would result in the introduction of a substantial new source of light as asserted by the commentor. The Draft EIR includes an analysis of potential light and glare impacts that may occur as a result of project implementation.

As noted in the Draft EIR, "*project-related lighting impacts were determined to be less than significant because all development in the City, which includes light generated from warehouse buildings and parking lots, is required to adhere to lighting requirements contained in the City's Municipal Code (Section 9.08.100 Lighting), which states that any outdoor lighting associated with nonresidential uses shall be shielded and directed away from the surrounding residential uses. Such lighting shall not exceed one-half foot-candle at all property lines and shall not blink, flash, oscillate, or be of unusually high intensity or brightness. Lighting in parking areas and drive aisles must be at least 1.0 foot-candle and cannot exceed a maximum of 8 foot-candles. Adherence to the City's Zoning Code would ensure that any building or parking lighting would not significantly impact adjacent uses. Therefore, impacts associated with this issue are less than significant and no mitigation is required.*"

Response to Comment D-13. The commentor misidentifies the existing farmland designations on-site. As detailed in the Draft EIR (Section 4.1 Agriculture and Forestry Resources, page 4.1-5), "*Approximately 16.89 acres (23%) of the project site is designated as Prime Farmland,*[1] *16.23 acres (23%), is designated Farmland of Statewide Importance, and 38.69 acres (54%) is designed Farmland of Local Importance.*" No Unique Farmland exists on-site. Additionally, the Draft EIR accurately identifies that the project would result in the significant and unavoidable conversion of farmland to a non-agricultural use (Draft EIR Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-14).

Response to Comment D-14. The comment is noted. As described in Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-10 of the Draft EIR, "*The conversion of the 16.89 acres of on-site Prime Farmland would be equivalent to 0.03 percent of the total loss of Prime Farmland in the County during this period. Similarly, the conversion of the 16.23 acres of on-site Farmland of Statewide Importance would be equivalent to 0.07 percent of the total loss of Farmland of Statewide Importance in the County during this period. The conversion of the 38.69 acres of on-site Farmland of Local Importance would be equivalent to 1.89 percent of the total loss of Farmland of Local Importance in the County during this period.*" This level of conversion expressed in percentages that would occur with project implementation over the course of a two-year reporting period for the County

[1] Important Farmland Map Riverside County, Farmland Mapping and Monitoring Program, 2004.

does not represent a substantial conversion of farmland within the County. Furthermore, the Draft EIR accurately identifies that the project would result in the significant and unavoidable conversion of on-site farmland to a non-agricultural use (Draft EIR, Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-14).

Response to Comment D-15. There are no agricultural land uses designated or zoned adjacent to the proposed project site. As described in the Draft EIR (Section 4.1 Agriculture and Forestry Resources, page 4.1-1), "*Developed properties in the vicinity include a waste transfer station and an industrial/warehouse to the north; industrial/warehouse and undeveloped property to the south; industrial/warehouses and a self-storage facility to the east; and warehouses, vehicle storage, residences, and undeveloped property to the west. Active agricultural operations (alfalfa) take place on properties located to the southwest of the project site, west of Indian Street and south of Harley Knox Boulevard*". The active agricultural uses identified in the Draft EIR are approximately 1,000 feet away.

The Draft EIR does not play down the effect of on-site development on adjacent agricultural uses or on properties along truck routes or citywide. As identified in the Draft EIR (Section, 4.1.6.1 Conversion of State Designated Farmland, page 4.1-12), "*the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the '…orderly conversion of agricultural lands.' The proposed project is a continued extension of development in the surrounding area (industrial/business park). The proposed project does not interfere with the ability of other adjacent properties to be used for agricultural production should the property owner wish to do so, nor does it create any gaps of vacant or agricultural land between the proposed project and the existing adjacent development.*" As described in the Draft EIR, the City's General Plan and General Plan EIR have considered and evaluated the eventual and expected conversion of agricultural activity within the City. The City has already anticipated the eventual conversion of all agricultural activity within the City.

Furthermore, to predict potential impacts of the conversion of active agricultural operations that are occurring citywide as a result of the implementation of the proposed project is speculative and outside the scope of the Draft EIR and CEQA. Agricultural activity within the City is an interim use until such time a development proposal is submitted for a particular project, which cannot be predicted.

Response to Comment D-16. The potential mitigation measures identified in this comment are not considered to be feasible by the City of Moreno Valley as determined in the City's General Plan EIR. As identified in the Draft EIR (Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-13), "*Williamson Act contracts are entered into voluntarily by property owners and the City cannot force owners to participate in this program. The City does have the ability to encourage property owners to participate in Williamson Act programs; however, this is expected to result only in temporary preservation of agricultural land since property owners have the option of non-renewal of these contracts at any time after the ten-year contract period ends. The land would then be available to be developed with urban uses.*

Providing protection for ongoing agricultural activities from new developments, such as requiring buffers between agricultural operation and new development or requiring the notification and disclosure of agricultural activities to the purchasers adjacent properties will not permanently protect agricultural land.

The purchase or transfer of development rights, purchase of conservation easements, or donation of funds to assist in the conservation of agricultural land would need to be implemented to ensure the preservation of agricultural land. As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City's Development Code for all zoning categories. Moreno Valley has determined that these measures are economically infeasible based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. Furthermore, these measures are contrary to the City's vision (as stated in its General Plan) for the project site; therefore, they are not feasible and alternative mitigation has not been identified."

The Table below contains the suggested mitigation measures by the commentor. The responses determine whether the Draft EIR contains the mitigation measure, if the mitigation will be added mitigation as part of the Final EIR, or if it will not be included and why.

Suggested Mitigation Measure	Response
1. The purchase of agricultural conservation easements;	**Economically infeasible.** Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. The site has been planned for industrial uses since 1987, the City has recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of is not required. An easement does not compensate for the impact by replacing or providing substitute resources or environments (i.e., the easement would not create any new farmland where no farmland presently exists). See Fourth District Court of Appeal, *Cherry Valley Pass Acres and Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316 (*Cherry Valley*)
2. Transfer of development rights;	**Economically infeasible.** Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable.
3. Acquisition of farmland by the city or county;	**Economically infeasible**. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable No mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations.
4. Mitigation banking;	**Economically infeasible**. Neither the City of Moreno Valley or the County have a mechanism in place for mitigation banking. The site has been planned for industrial uses since 1987, the City has recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of is not required. In addition, there is not any agricultural zoned land in the City for the City or County to purchase.

Suggested Mitigation Measure	Response
5. The establishment of "urban limits," greenbelts, and buffers;	**Not sufficient.** Will not result in permanent protection of agricultural lands. There is no mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations.
6. The payment of in-lieu fees sufficient to a purchase and maintain farmland conservation easements;	**Economically infeasible**. Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. An easement does not compensate for the impact by replacing or providing substitute resources or environments (i.e., the easement would not create any new farmland where no farmland presently exists). See (Fourth District Court of Appeal, *Cherry Valley Pass Acres and Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316 (*Cherry Valley*) In addition, there is not any agricultural zoned land in the City for the City or County to purchase and there is no existing fee program for farm land in the City.
7. Planning tools such as clustering development, use of density bonuses, and limiting "leapfrog" development.	**Economically infeasible.** Based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. In addition the project is an industrial project which the site is planned for in the City's General Plan since 1987. In addition, this is not a residential project. The proposed mitigation is not applicable. The project won't promote "leapfrog" development since the area surrounding the project site is developed.

Response to Comment D-17. Please refer to Response to Comment D-16.

Response to Comment D-18. This comment is noted. The commentor has correctly identified potential air quality impacts of the proposed project. The Draft EIR also identifies the same significant and unavoidable air quality impacts as occurring during construction and operation of the project (Draft EIR Section 4.2 Air Quality, pages 4.3-23, 4.2-25 and 4.3-28 through 4.3-29).

Response to Comment D-19. The Draft EIR Section 4.2 Air Quality includes a discussion of the applicable SCAQMD regional rules that are required of all development within the South Coast Air Basin as well as project-specific mitigation measures. The Draft EIR distinguishes between measures that are required by rules enforced by the SCAQMD and proposed mitigation measures identified to reduce potential impacts. The Draft EIR then presents data reflecting the anticipated reduction of emissions achieved as a result of both rules enforced by the SCAQMD and project-specific mitigation measures. The Draft EIR includes text on page 4.2-21 stating, "*To facilitate monitoring and compliance, applicable SCAQMD regulatory requirements are restated in the following mitigation. These measures shall be incorporated in all project plans, specifications, and contract documents.*" No further discussion is required.

Response to Comment D-20. This comment is noted. The commentor has correctly identified existing ambient air quality conditions in the project vicinity and the location of the nearest sensitive receptors. The Draft EIR Section 4.2 Air Quality, Table 4.2.D page 4.2-5 and page 4.2-6 (Section 4.2.1.5 Sensitive Land Uses in the Project Vicinity) also identifies the same ambient air quality conditions and locations of the nearest sensitive receptors.

Response to Comment D-21. The Draft EIR Section 4.2.3.4 Local Policies, page 4.2-9, includes a discussion of the City's General Plan and the policies relevant to air quality. The goals, objectives, and policies cited by the commentor are in portions of the General Plan that deal with public safety and energy conservation, but are included here to address the comment:

Ultimate Goal VII: Emphasizes public health and safety, including, but not limited to, police, fire, emergency and animal services and protection from floods and other hazards.

> *Response:* Section 2.5.10 of the Draft EIR addressed public health and safety relative to the cited public services, and Section 2.5.12 of the Draft EIR addressed utilities including energy use (i.e., the wise use of energy is considered energy conservation). The Draft EIR evaluated these issues and determined that the proposed project would not have significant impacts related to public health and safety (public services) and energy use/conservation with implementation of the project as proposed with the recommended mitigation. Therefore, the proposed project is consistent with this goal.

Goal 6.1: To achieve acceptable levels of protection from natural and man-made hazards to life, health, and property.

> *Response:* Section 4.2 of the Draft EIR addresses health impacts related to air quality (i.e., health risk assessment), Section 2.5.5 of the Draft EIR addresses hazards and hazardous materials, Section 2.5.4 of the Draft EIR addresses geotechnical hazards, and Section 2.5.6 addresses water-related hazards. The EIR concluded that these impacts would be less than significant based on the design of the project and implementation of recommended mitigation measures except for specific daily thresholds for construction and operational air pollutants.
>
> NOTE: The project's consistency with Objective 7.5 and Policies 7.5.1, 7.5.2, and 7.5.5 regarding energy efficiency is included in Chapter 4.3 Climate Change and Greenhouse Gases, which begins on Draft EIR page 4.3-1. However, the following information is provided for the reader's convenience.

OBJECTIVE 7.5: ENCOURAGE EFFICIENT USE OF ENERGY RESOURCES.

> *Response:* Section 2.5.12 of the Draft EIR examines the project's use of energy resources such as electricity and natural gas and concludes that the potential impacts will be less than significant after compliance with the State's new "Green Building Code" (Title 24) including strict energy conservation requirements. In addition, Mitigation Measure 4.2.6.3A (under Air Quality) also addresses energy conservation.

Policy 7.5.1: Encourage building, site design, and landscaping techniques that provide passive heating and cooling to reduce energy demand.

> *Response:* Sections 2.5.12 (Utilities) and 4.2 (Air Quality) of the Draft EIR addresses the design of the project relative to wise energy use (i.e., energy conservation) and determined that impacts in this regard would be less than significant with implementation of the state Green Building Code as well as implementation of Mitigation Measures 4.2.6.3A.

Policy 7.5.2: Encourage energy efficient modes of transportation and fixed facilities, including transit, bicycle, equestrian, and pedestrian transportation. Emphasize fuel efficiency in the acquisition and use of City-owned vehicles.

> *Response:* The proposed project does implement the recommended improvements related to private development in this policy (i.e., bicycle racks, pedestrian access).

Policy 7.5.5: Encourage the use of solar power and other renewable energy systems.

Response: The proposed project does not have a specific end user at this point, but the building design will allow for future installation of solar photovoltaic and solar hot water heating for the office area.

Summary. As stated in section 15002 of the CEQA Guidelines, the basic purposes of CEQA are to 1) Inform governmental decision makers and the public about the potential, significant environmental effects of proposed activities; 2) Identify ways that environmental damage can be avoided or significant reduced; 3) Prevent significant, avoidable damage to the environment by requiring changes in projects through the use of alternative or mitigation measures when the governmental agency find the changes to be feasible; and 4) Disclose to the public the reasons why a governmental agency approved the project in the manner the agency chose if significant environmental effects are involved. While the suggested goals are not cited in the Draft EIR for reasons stated previously, this Draft EIR meets the basic purposes of CEQA and adequately discloses potential project-related effects to human health and the environment within Sections 4.2 Air Quality (beginning on page 4.2-1), 4.3 Climate Change and Greenhouse Gases (beginning on page 4.3-1), 4.4 Noise (beginning on page 4.4-1), and 4.5 Transportation (beginning on page 4.5-1).
Based on project design, compliance with existing regulations and implementation of the recommended mitigation measures protects public health and safety and achieves responsible energy conservation to the extent required by the lead agency under CEQA. Therefore, the proposed project is consistent with these General Plan goals, objectives, and policies.

Response to Comment D-22. Since there is no specific end user identified at this time, it is not known if employees will be relocated from another facility. It should be noted that even relocation of an existing use from elsewhere in the region still benefits the local economy. The relocation of employees may have an indirect employment impact in other jurisdictions but an overall neutral effect on the region (likely the jobs would still stay within the region). It is speculative to predict such employment changes since the end user is not known at this time. The cited online article makes no assertion that vehicle miles travelled (VMT) were increased due to an employee transfer and the commentor provides no evidence that this was the case in that example. The context of the analysis the commentor is commenting on relates to the project's consistency with the Air Quality Management Plan (AQMP) and how the project may accommodate the expected increase in population and employment in the City. The project is consistent with existing General Plan and Zoning designations and therefore it is reasonable to assume that given the proximity of existing homes and existing commercial uses in the area coupled with the City's existing low jobs-to-housing ratio (i.e., below the existing SCAG jobs-to-housing ratio), the project has the potential to minimize the VMT within the community.

Response to Comment D-23. The Draft EIR does not find that the project will minimize VMT compared to a "typical" large industrial/warehouse type project. However, this project provides the opportunity for a reduction in employee-related VMT because the proposed project will create jobs and provide the opportunity for City of Moreno Valley residents to find employment close to their homes. Because of the high unemployment levels in the City of Moreno Valley, this potential is real. However, the commute travel reduction is virtually impossible to calculate. Nonetheless, the project will create the potential for reduction in commuting distances for employees that reside in the City or in other municipalities near the project site.

Response to Comment D-24. The conclusion referenced in this comment is based on the previous assessment of localized operational impacts to sensitive receptors (Section 4.2.5.4). Because the project would not result in any exceedances of localized operational emissions thresholds,

operational acute health risk impacts are expected to be less than significant. Additional language has been added to Section 4.2.5.5 of the Section 3.0 Errata Final EIR to refer the reader back to the previous Section 4.2.5.4 to clarify this point.

Draft EIR Section 4.2.5.5, Operational-Acute Health Risk Impacts Page 4.2-18

4.2.5.5 Operational-Acute Health Risk Impacts

Threshold Would the proposed project expose sensitive receptors to substantial pollutant concentrations?

Exposure to diesel exhaust can have immediate health effects, such as irritation of the eyes, nose, throat, and lungs, and it can cause coughs, headaches, light headedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. However, according to the rulemaking on *Identifying Particulate Emissions from Diesel-Fueled Engines as a Toxic Air Contaminant* (ARB 1998), the available data from studies of humans exposed to diesel exhaust are not sufficient for deriving an acute non-cancer health risk guidance value. While the lung is a major target organ for diesel exhaust, studies of the gross respiratory effects of diesel exhaust in exposed workers have not provided sufficient exposure information to establish a short-term non-cancer health risk guidance value for respiratory effects. As previously identified in Section 4.2.5.4, none of the criteria pollutant emissions would exceed localized thresholds during the operation of the proposed project. Therefore, the proposed project would not have a significant impact on localized operational pollutant levels and no mitigation measures would be required. Similarly ~~Therefore~~, the potential for short-term acute exposure from diesel exhaust are considered to be less than significant and no mitigation is required.

Response to Comment D-25. The HRA analysis provided in the Draft EIR Section 4.2.5.5 Operational-Acute Health Risk Impacts, page 4.2-18, evaluated the health risk levels at all locations within the area covered by the receptor grid which covers the area surrounding the project and extends out to beyond where the project contribution to ambient air quality is measurable. As stated in the technical Health Risk Analysis (HRA) prepared for the project: Receptors were placed at a grid approximately five by five miles to characterize the regional risk levels and at locations of all identified sensitive receptors" (see page 12 of the HRA contained in Appendix D-2 of the Draft EIR). Within the accuracy of the air dispersion model, using a grid of receptors to allow the display of area-wide distributions and wind effects is a much better indication of predicted pollutant concentrations than only placing a single receptor at a location of interest. This is in accordance with SCAQMD HRA methodology. Furthermore, the HRA considers a worst-case scenario (i.e., health risks at the nearest receptors); therefore, it can be expected that health risks at locations further away would be less than that at the nearest receptors.

Response to Comment D-26. This comment is noted. The HRA analysis provided in the Draft EIR Section 4.2.5.5 Operational-Acute Health Risk Impacts and Section 4.2.5.6 Operational-Chronic Health Risk Impacts, page 4.2-18 includes all health risks for which there are accepted analysis methods. The health effects described in the comment do not have methodologies to support inclusion.

Response to Comment D-27. This commentor is stating the facts on diesel emissions provided by the SCAQMD and is noted. No response is required.

Response to Comment D-28. This comment is a statement of fact and is noted. No response is required.

Response to Comment D-29. The HRA analysis provided in the Draft EIR, Section 4.2.5.6 Operational-Chronic Health Risk Impacts, page 4.2-18 accounted for the health risks to all the populations affected by the predicted emissions from the project operations including children. In addition the Draft EIR, Section 4.2.1.5 Sensitive Land Uses in the Project Vicinity, page 4.2-6 identifies those sensitive receptors in the area of the proposed project that are sensitive to air pollutants, which includes residences, schools, medical offices, convalescent facilities, and similar uses. The susceptibility of various portions of the population, including infants and children as well as older people are all considered and analyzed, which includes diesel emissions, in both the air quality and HRA sections of the Draft EIR (Sections 4.2 and 4.3, respectively).

Response to Comment D-30. This comment is a statement of fact and is noted. The City of Moreno Valley General Plan is the governing body for the proposed project not the Riverside County General Plan. Consistency of the project with the Riverside General Plan is not required.

Response to Comment D-31. This comment is a statement of fact and is noted. The commentor does not provide a reference for the statement and there is confusion as to how the bullet item relates to the analysis in the Draft EIR. No response is required.

Response to Comment D-32. This comment is a statement of fact and is noted. The commentor does not provide a reference for the statement and there is confusion as to how the bullet item relates to the analysis in the Draft EIR. The proposed project and the respective HRA prepared for the project and summarized in the Draft EIR, complies with the City of Moreno Valley General Plan policies. The City of Moreno Valley General Plan is the governing body for the proposed project not the Riverside County General Plan. Consistency of the project with the Riverside County General Plan is not required.

Response to Comment D-33. The section title has been changed to reflect that the analysis considers all construction emissions and the change is provided in Section 3.0 Errata in the Final EIR.

Draft EIR Section 4.2.6.1 Construction Emissions, Page 4.2-19

4.2.6.1 Construction ~~Equipment~~ Emissions

Response to Comment D-34. The data shown in Table 4.2.I of the Draft EIR contains typographical errors; however, Table G: Short-Term Regional Construction Emissions in the Air Quality report (Appendix D-1) in the Draft EIR is correct. The 5.95.9 lbs/day of ROG is a typographical error; the actual emission value is 5.9. The 3434 lbs/day of NO_x is also a typographical error; the actual emission value is 34 lbs/day (see Draft EIR Appendix D-1, Air Quality Study). The numbers in Table 4.2.1 under Fugitive Dust PM_{10}, Exhaust PM_{10}, Fugitive $PM_{2.5}$ and Exhaust $PM_{2.5}$ are also typographical errors and now match the table in the Air Quality Report in Appendix D-1inthe Draft EIR. The amendments to Table 4.2.1 do not change the analysis or the conclusions in the Section 4.2 Air Quality in the Draft EIR. The changes to Table 4.2.I have been included in Section 3.0 Errata in the Final EIR.

Draft EIR Section 4.2.6.1 Construction Emissions, Page 4.2-20.

Table 4.2.I: Short-Term Regional Construction Emissions

Construction Phase	Pollutant Emissions (lbs/day)

CO = carbon monoxide
CO_2 = carbon dioxide
lbs/day = pounds per day
NO_x = nitrogen oxides
$PM_{2.5}$ = particulate matter less than 2.5 microns in size
PM_{10} = particulate matter less than 10 microns in size
ROG = reactive organic compounds
SO_x = sulfur oxides
SCAQMD = South Coast Air Quality Management District

Source: LSA Associates, Inc., December 2011.

Feasible mitigation measures, including several identified in the list provided by the commentor, have been already included as mitigation for the project and are identified in the Draft EIR. In addition, the mitigation measures shown as "Incorporated" have been added to the Final EIR (Section 3.0 Errata) as suggested by the commentor. The changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the EIR. The Table below contains each of the mitigation measures suggested for inclusion by the commentor and if it is already included in the Draft EIR, if will be added mitigation as part of the Final EIR, or if will not be included and why.

Suggested Mitigation Measure	Response
1. Gravel pads must be installed at all access points to prevent tracking of mud onto public roads.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
2. Install and maintain trackout control devices in effective condition at all access points where paved and unpaved access or travel routes intersect (eg. Install wheel shakers, wheel washers, and limit site access.)	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
3. All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-23) of the Air Quality Section as **Mitigation Measure 4.2.6.1R** and summarized in the Errata Section of the Final EIR to include this specific requirement as suggested.
4. Pave all construction roads.	**Not Included**. All roads surrounding the site are already paved. This suggested mitigation measure is not warranted.
5. Pave all construction access roads at least 100 feet on to the site from the main road.	**Not Included.** This suggested mitigation measure is not included in Section 4.2 Air Quality of the Draft EIR because it is impractical to pave construction roads onsite. It is infeasible and ineffective to pave roads within the site as the

Suggested Mitigation Measure	Response
	entire site will be graded to process the 220,000 cubic yards of fill to be imported. Such temporary pavement would present unnecessary obstacles and would be destroyed in the process of construction. Paving construction roads within construction areas unnecessarily increase VOC generation, with little or no discernible reduction in other air pollutant emissions. Fugitive dust control is already addressed by **Mitigation Measures 4.2.6.1E** and **4.2.6.1F**.
6. Limit fugitive dust sources to 20 percent opacity.	**Not Included.** The context of this suggested mitigation measure is unclear. It is not feasible to limit fugitive dust *sources* to 20 percent opacity. It is inferred that the commentor is suggesting that fugitive dust *emissions* should be limited to 20 percent opacity consistent with SCAQMD Rule 403. SCAQMD Rule 403 is a regional requirement required of all development within its jurisdiction; therefore, the project is required to adhere to this requirement.
7. Require a dust control plan for earthmoving operations.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** and **4.2.6.1L** on page 4.2-23.
8. When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-24) of the Air Quality Section as **Mitigation Measure 4.2.6.1N** and summarized in the Errata Section of the Final EIR to include this specific requirement as suggested.
9. All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-23) of the Air Quality Section as **Mitigation Measure 4.2.6.1O** and summarized in the Errata Section of the Final EIR to include this specific requirement as suggested.
10. The contractor or builder shall designate a person or persons to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust offsite.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
11. Post a publicly visible sign with the telephone number and person to contact regarding dust complaints. This person shall respond and take corrective action within 24 hours.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
12. Extend grading period sufficiently to reduce air quality impacts below a level of significance.	**Not Included.** This suggested mitigation measure is not included in Section 4.2 Air Quality of the Draft EIR because extending the grading period would not likely achieve a level of reduction great enough to reduce air quality impacts during the grading phase. In fact, extending the grading period would result in an increase in worker vehicle and construction equipment-related emissions, increasing the severity of the impact. In addition, the same quantity of fugitive dust would be emitted to the air basin under this suggestion and impacts associated with regional emissions would not be reduced. Also refer to the response to #13 below.
13. The simultaneous disturbance of the site shall be limited to five acres per day.	**Not Included.** As noted in the CalEEMod manual, "*In order to properly grade a piece of land multiple passes with equipment may be required. The acres is based on the*

Suggested Mitigation Measure	Response
	equipment list and days in grading or site preparation phase according to the anticipated maximum number of acres a given piece of equipment can pass over in an 8-hour workday. The equipment specific grading rates are given in the table below as determined by SCAQMD in consultation with building estimator references." Thus, the CalEEMod calculates a total grading disturbed area many times the size of the project site based on the idea that there are multiple graders, dozers, scrapers, etc. making multiple passes during any one day. This suggested measure to limit simultaneous disturbance of the site to 5 acres per day would not change the results of the air quality modeling and projected air emissions identified in the Draft EIR and in fact may increase emissions due to the grading inefficiencies created by this restriction. By grading a smaller area it prolongs the grading process and releases dust and vehicular emissions (grading construction workers going back and forth to the site over a greater period of time and grading equipment moving around the site) into the air basin over a longer period of time. By grading five acres a day of a minimum grading of 7 days based on a 71 acre site at 10 acres a day the grading would be prolonged to 14 days. There are also logistical considerations getting construction equipment and people back and forth to the site. In addition, there are no sensitive receptors located in close proximity to the project site that would be affected by the dust.
14. Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-23) of the Air Quality Section as **Mitigation Measure 4.2.6.1P** and summarized in the Errata Section of the Final EIR to include this specific requirement as suggested.
15. Any on-site stockpiles of debris, dirt or other dusty material shall be covered or watered three times daily.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measures 4.2.6.1E** and **4.2.6.1G** on page 4.2-22.
16. Any site access points within 30 minutes of any visible dirt deposition on any public roadway shall be swept or washed.	**Not Included.** It is not clear what is being suggested by this measure. Trackout (i.e., dirt deposition) is addressed through adherence to **Mitigation Measure 4.1.6.1K**.
17. A high wind response plan shall be formulated for enhanced dust control if winds are forecast to exceed 25 mph in any upcoming 24-hour period.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1D** on page 4.2-22. While **Mitigation Measure 4.2.6.1D** does not specify the formulation of a high wind response plan as suggested, this mitigation measures requires that clearing, grading, earthmoving, or excavation activities cease upon 25 mph winds or greater. This requirement in combination with other dust control measures outlined in the Draft EIR will accomplish the intent of the suggested mitigation measures stated here.
18. Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-23) of the Air Quality Section as **Mitigation Measure 4.2.6.1S** and summarized in the Errata Section of the Final EIR to include a similar requirement regarding

Suggested Mitigation Measure	Response
large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.	scheduling truck trips during non-peak hours as suggested. Approval of a truck haul route is already required prior to grading permit approval. commentor
19. Develop a trip reduction plan to achieve a 1.5 AVR for construction employees	**Not Included.** This suggested mitigation measure is not feasible because construction of this type typically requires a large number of small contractors rather than one large contractor such as for large public works projects. Having multiple small contractors means that workers come from many areas and do not work for the same company, therefore, making efforts to coordinate their carpooling ineffective and infeasible. As noted in **Mitigation Measure 4.2.6.1K**, documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs. In addition, it should be noted that California Public Health and Safety Code Section 40717.9 states that a "public agency shall not require an employer to implement an employee trip reduction program unless the program is expressly required by federal law and the elimination of the program will result in the imposition of federal sanctions, including, but not limited to, the loss of federal funds for transportation purposes."
20. Require high pressure injectors on diesel construction equipment.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
21. Restrict truck operation to "clean" trucks, such as a 2007 or newer model year or 2010 compliant vehicles.	**Not Included. Mitigation Measure 4.2.6.1C** which requires CARB Tier II Certified equipment or better (page 4.2-21) is identified in the Draft EIR. Where feasible, CARB Tier II Certified equipment or better will be used during construction of the project. The suggested mitigation measures is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, and technological factors and is infeasible.
22. Require the use of CARB certified particulate traps that meet level 3 requirements on all construction equipment.	**Not Included. Mitigation Measure 4.2.6.1C** which requires CARB Tier II Certified equipment or better (page 4.2-21) is identified in the Draft EIR. Where feasible, CARB Tier II Certified equipment or better will be used during construction of the project. infeasible because of CARB off-road regulation changes approved in 2011 making exhaust retrofits of particulate traps no longer mandatory that requiring their use is not feasible.
23. Utilize only CARB certified equipment for construction activities.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1C** on page 4.2-21.
24. The developer shall require all contractors to turn off all construction equipment and delivery vehicles when not in use and/or idling in excess of 3 minutes.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1M** on page 4.2-23.
25. Restrict engine size of construction	**Included.** This suggested mitigation measure is already

Suggested Mitigation Measure	Response
equipment to the minimum practical size.	included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
26. Use electric construction equipment where technically feasible.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
27. Substitute gasoline-powered for diesel-powered construction equipment.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
28. Require use of alternatively fueled construction equipment, using, e.g., compressed natural gas, liquefied natural gas, propane, or biodiesel.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-22.
29. Use methanol-fueled pile drivers.	**Not Included.** Project construction does not require use of pile drivers.
30. Install catalytic converters on gasoline-powered equipment.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-23.
31. Require the use of Alternative Diesel Fuels on diesel equipment used. Alternative diesel fuels exist that achieve PM_{10} and NO_x reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NO_x and a 63% reduction in PM_{10} compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.	**Not Included.** It has been determined that Lubrizol, the producer of PuriNox ceased production of PuriNox in December 2006. Additionally, SCAQMD has previously confirmed that PuriNox is not expected to be commercially available in the foreseeable future. Thus, the suggested mitigation measure is not capable of being accomplished in a successful manner within a reasonable period of time because PuriNox is not available commercially. In addition, the requirement to use alternative diesel fuel depends on the availability of such fuel which according to the SCAQMD is not available.
32. Electrical powered equipment shall be utilized in-lieu of gasoline-powered engines where technically feasible.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
33. All forklifts shall be electric or natural gas powered.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
34. Suspend use of all construction equipment operations during second stage smog alerts.	**Incorporated.** As noted on the SCAQMD website (http://www.aqmd.gov/aqmd/index.html), the Basin has not experienced a Stage II smog alert since the 1980's. This is due to cleaner burning fuels in vehicles and more stringent rules BY AQMD regarding PM_{10} and $PM_{2.5}$. While the occurrence of a Stage II smog alert cannot be predicted. It is reasonable to assume that a Stage II smog alert would not occur during the construction phase of this project. However, as precaution the mitigation measure has been added to the Errata Section of the Final EIR as a bullet item under **Mitigation Measure 4.2.6.1K.**
35. Provide temporary traffic controls such as a	**Incorporated.** Additional text has been added to Section

Suggested Mitigation Measure	Response
flag person, during all phases of construction to maintain smooth traffic flow.	4.2.6.1 (page 4.2-24) of the Air Quality Section as **Mitigation Measure 4.2.6.1Q** and summarized in the Errata Section of the Final EIR to include this specific requirement as suggested.
36. Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site.	**Not Included.** The project site is bounded by Perris Boulevard to the east, Grove View Road to the north, Indian Street to the west, and Perris Valley Storm Channel (PVSC Lateral D unimproved service road) to the south. Perris Boulevard and Grove View Road are improved with curb and gutter on lanes adjacent to the project site, while Indian Street contains a strip of unimproved right-of-way adjacent to the project site. Perris Boulevard contains a raise center median, so left-turn access to/from the site is not possible. Access onto the project site is readily available along Grove View Road and Indian Street. Grove View Road is a low-volume street containing a center two-way left turn lane and already contains adequate provisions for truck access to the site. It is anticipated that the truck haul route permit will require that trucks access the site via Gove View Road.
37. Reroute construction trucks away from congested streets and sensitive receptor areas.	**Incorporated.** Additional text has been added to Section 4.2.6.1 (page 4.2-23) of the Air Quality Section as **Mitigation Measure 4.2.6.1T** and summarized in the Errata Section of the Final EIR as suggested. Approval of a truck haul route is already required prior to grading permit approval.
38. Configure construction parking to minimize traffic interference.	**Not Included.** The project site is bounded by Perris Boulevard to the east, Grove View Road to the north, Indian Street to the west, and Oleander Avenue (PVSC Lateral D unimproved service road). Perris Boulevard and Grove View Road are improved with curb and gutter on lanes adjacent to the project site, while Indian Street contains a strip of unimproved right-of-way adjacent to the project site. Access onto the project site is readily available along Perris Boulevard, Grove View Road and Indian Street. Construction parking is expected to be onsite at the discretion of the construction contractor to facilitate construction of the site.
39. Prior to the issuance of a grading and building permit, the applicant shall submit verification that a ridesharing program for the construction crew has been encouraged and will be supported by the contractor via incentives or other inducements.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
40. Minimize construction worker trips by requiring carpooling and providing for lunch onsite.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
41. Provide shuttle service to food service establishments/commercial areas for the construction crew.	**Not Included.** This suggested measure is counterproductive to the suggested measures identified in row 40 above and **Mitigation Measure 4.2.6.1K**. In addition, construction workers tend bring their own lunch because they take a limited lunch break. For this reason, the suggested measure will result in additional vehicular emission as compared to without the suggested measure. Thus, this suggested measure is not warranted.
42. Provide shuttle service to transit stations/multimodal centers for the	**Not included. .** This mitigation measure is not practical since the nearest multimodal center is in downtown Riverside

MV00170204

Suggested Mitigation Measure	Response
construction crew.	located 14.5 miles northwest of the project site. In addition, the Riverside Transit Authority (RTA) has an established bus route, No. 19, which services the project area and the site. The RTA has two stops one on either side of Perris Blvd. and Grove View Rd. From the project site the walk north along Perris Blvd. is approximately 0.2 mile to a stop at Perris Blvd and Nandina. There is another bus stop at 17800 Perris Blvd. approximately 0.1 mile from the project site. Therefore, the site is serviced by the RTA and no further actions are necessary.
43. Require the use of Zero-VOC paints, coatings, and solvents.	**Included.** To the extent feasible, this suggested mitigation measure is partially included (low-VOC vs. zero-VOC) in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1J** on page 4.2-23 in accordance with SCAQMD Rule 1113.

~~* Would reduce impacts to GHGs as well~~

Response to Comment D-35. The language in Mitigation Measure 4.2.6.1.B in the Draft EIR is as specific as is possible, while still allowing the possibility that the construction contractor can implement it. Requiring the project contractor to utilize electricity from power poles may result in infeasibility if power poles do not exist on-site. Clean-fuel is fuel other than diesel or gasoline. Clarification of the term "clean-fuel" has been incorporated into the Final EIR.

Draft EIR Section 4.2.6.1 Construction Equipment Exhaust Emissions Page 4.2-21.

> **4.2.6.1B**. Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

Response to Comment D-36. The air quality analysis of construction shows that there will be exceedances of ROG, NO_X and PM_{10}. Tier III applies to equipment produced from 2006 to 2008. As of 2012, equipment produced since 2006 are becoming more readily available, but not to the extent that requiring their use is considered feasible mitigation. Tier II specifications result in a substantial reduction in PM_{10} and $PM_{2.5}$ (62.5% to 72.5%, depending on horsepower) over Tier I equipment, which is the basis of the mitigation measure. Tier III specifications are identical to Tier II for PM_{10} and $PM_{2.5}$, thus requiring this more stringent mitigation would have no benefit to the reduction in PM_{10} and $PM_{2.5}$ and was not required.

Response to Comment D-37. Mitigation Measure 4.2.6.1.K as written in the Draft EIR requires that the listed measures be included in "grading plans, construction specifications and bid documents". Once in these documents, they become requirements, enforceable by the City or other regulatory agencies. However, the wording of this and similar measures will be reworded to strengthen the implementation requirement of each measure.

Response to Comment D-38. Although the exact effects of the measures listed are not fully quantifiable at this time, the language of the measure will be changed to require implementation of all the listed design features, rather than a future combination of features, as shown below:

Draft EIR Section 4.2.6.3 Long-Term Operational Emissions, Page 4.2-26.

4.2.6.3A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent which is considered sufficient by CARB and the SCAQMD to achieve the AB 32 conservation goals for 2020. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and review and approved by the City. The following ~~Any~~ combination of design features, ~~including but not limited to the following list, may~~ shall be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: *(note: the list of design features remains the same except for changes outlined in Response D-39 below)*

Changes to this mitigation measure are provided in Section 3.0 Errata of the Final EIR.

The significant impact that these mitigation measures apply to are almost entirely from mobile sources. The emissions exceed the thresholds by up to 1,700%. There are no feasible mitigation measures available to reduce these emissions to anywhere close to the thresholds, therefore; 20% was proposed by the project as a good-faith effort to make a meaningful reduction.

Response to Comment D-39. The only agencies that have any control over the production of vehicles used with this project, and therefore the emissions controls installed on those vehicles, is the California Air Resources Board and the United States EPA. The indirect control the City has over vehicle operations associated with land use decisions cannot not have a substantial effect on the project's air quality impact as the vehicle emissions of concern are from trucks traveling throughout the Air Basin, far outside the City limits.

Response to Comment D-40. Impact 4.2.6.3 is the air quality impact from operational emissions of the project to the regional air quality. This impact statement includes a typographical error and Section 3.0 Errata of the Final EIR incorporates the amended language to clarify the impact statement.

Draft EIR Section 4.2.6.3 Long-Term Operational Emissions, Page 4.2-25.

> **Impact 4.2.6.3:** *Implementation of the proposed project may ~~occur~~ have the potential to exceed applicable daily thresholds for operational activities.*

Response to Comment D-41. This comment reiterates the conclusions presented in the Draft EIR. The rounding of the results is entirely appropriate. It is not inaccurate to report that emissions would be 990.93 lbs/day when all that can really be reported is that the peak emissions could be anywhere between 970 and 990 lbs/day and will be far less for most of the time.

Response to Comment D-42. The wording of Mitigation Measure 4.2.6.3A has been modified to address this comment as outlined in Responses to Comments D-38 and D-39. In addition, the mitigation measures focus on the only project emissions that the project has any ability to reduce.

Response to Comment D-43. The wording of Mitigation Measure 4.2.6.3A has been modified to address this comment as outlined in Responses to Comments D-38 and D-39.

Response to Comment D-44. The wording of Mitigation Measure 4.2.6.3A has been modified to address this comment as outlined in Responses to Comments D-38 and D-39.

Response to Comment D-45. It is not feasible to mandate mitigation on equipment that is controlled by the State and federal governments. As the EIR is only for the construction of the project and the operator has not been identified, the EIR can only specify mitigation that can be implemented by the builder. At the time the operator is known, it is at the City's discretion to impose operating parameters to the operator of the facility.

Feasible mitigation measures, including several identified in the list provided by the commentor, have been already included as mitigation for the project and are identified in the Draft EIR. In addition, the mitigation measures shown as "Incorporated" have been added to the Final EIR (Section 3.0 Errata) as suggested by the commentor. The changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the EIR. The Table below contains each of the operational emissions mitigation measures suggested for inclusion by the commentor. If the measure is included in the Draft EIR the response indicates "included". If the mitigation is being added as part of the Final EIR the response indicates "incorporated", or if the measure is not included the response discusses why the Final EIR does not contain the measure.

Suggested Mitigation Measure	Response
1. The operator of the primary facilities shall become SmartWay Partner.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
2. The Project shall meet SmartWay 1.25 ratings.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
3. The project shall use only freight companies that meet SmartWay 1.25 ratings.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
4. (ALTERNATIVELY from 2,3 above) The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
5. The operator of the primary facilities shall incorporate requirements or incentives sufficient to achieve a 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidator trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers. Results, including backup data shall be reported to the Planning Department semi-annually.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
6. All fleet vehicles shall conform to 2010 air quality standards or better. Results, including backup data shall be reported to the Planning Department semi-annually.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
7. All spaces utilizing refrigerated storage, including restaurants and food or beverage stores, shall provide an electrical hookup for refrigeration	**Incorporated.** Similar language has been added to Section 4.2.6.3 (page 4.2-27) of the Air Quality Section under **Mitigation Measure 4.2.6.3A** and summarized in

Suggested Mitigation Measure	Response
units on delivery trucks. Trucks incapable of utilizing the electrical hookup for powering refrigeration units shall be prohibited from accessing the site. All leasing documents shall include these requirements and provide that violation of those provisions will constitute a material breach of the lease that will result in the termination of the lease. Because of the fact that these terms of the lease are designed to benefit the public, the public shall be considered to be a third party beneficiary with standing to enforce the requirements of the lease.	the Errata Section of the Final EIR to include a portion of the suggested requirement.
8. Install catalytic converters on gasoline-powered equipment.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-23.
9. Where diesel powered vehicles are necessary, require the use of alternative diesel fuels. Alternative diesel fuels exist that achieve PM10 and NOx reductions. PuriNOx is an alternative diesel formulation that was verified by CARB on January 31, 2001 as achieving a 14% reduction in NOx and a 63% reduction in PM10 compared to CARB diesel. It can be used in any direct-injection, heavy-duty compression ignition engine and is compatible with existing engines and existing storage, distribution, and vehicle fueling facilities. Operational experience indicates little or no difference in performance and startup time, no discernable operational differences, no increased engine noise, and significantly reduced visible smoke.	**Not Included.** It has been determined that Lubrizol, the producer of PuriNox ceased production of PuriNox in December 2006. Additionally, SCAQMD has previously confirmed that PuriNox is not expected to be commercially available in the foreseeable future. Thus, the suggested mitigation measures is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, and technological factors and is therefore infeasible. Heavy duty trucks using other types of alternative fuels are not yet widely available on the market at this time. In addition, there is no specific end user at this time, and a future user may already have a truck fleet that would make implementation of alternative fuel vehicles economically infeasible. As alternative fuel trucks become more widely available (e.g., compressed or liquefied natural gas) and are required in higher numbers at the SoCal ports, it is likely that project trucks will utilize alternative fuels.
10. Electrical powered equipment should be utilized in-lieu of gasoline-powered engines where technically feasible.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
11. Utilize electrical equipment for landscape maintenance.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
12. All forklifts shall be electric or natural gas powered.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1K** on page 4.2-23.
13. Utilize electric yard trucks.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
14. Prohibit idling of trucks for periods exceeding three minutes.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.1M** on page 4.2-23.
15. Provide electrical vehicle ("EV") and compressed natural gas ("CNG") vehicles in vehicle fleets.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.

Suggested Mitigation Measure	Response
16. Charge reduced or no parking fee for EVs and CNG vehicles.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28. While **Mitigation Measure 4.2.6.3A** does not specify reduce or no parking fees for these vehicles, it does specify the "provision of preferential parking."
17. Install EV charging facilities for a minimum of 10% of all parking spaces.	**Included.** To the extent feasible, a similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
18. Install a CNG fueling facility.	**Not Included.** The facility will not be able to take advantage of alternative fuel trucks as outlined previously in Item 9. The number of trucks this project would support does not justify the additional cost of installing a CNG fueling facility, and would likely be only one end user so the cost of such a facility could not be shared among a larger group of industrial users. Therefore, this measure is infeasible.
19. Provide preferential parking locations for EVs and CNG vehicles.*	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
20. Implement parking fee for single-occupancy vehicle commuters.	**Included.** To the extent feasible, a similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
21. Plant shade trees in parking lots to provide minimum 50% cover to reduce evaporative emissions from parked vehicles.	**Included.** To the extent feasible, this suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-26.
22. Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.	**Incorporated.** The suggested measure to plant low-ozone forming potential trees and shrubs has been added to the project mitigation under **Mitigation Measure 4.3.6.1B**.
23. Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.	**Incorporated.**. The suggested measure to plant low-ozone forming potential trees and shrubs has been added to the project mitigation under **Mitigation Measure 4.3.6.1B**.
24. Orient 75 percent or more of homes and buildings to face either north or south (within 30 degrees of N/S) and plant trees and shrubs that shed their leaves in winter nearer to these structures to maximize shade to the building during the summer and allow sunlight to strike the building during the winter months.	**Not Included** The suggested mitigation measure to orient buildings north or south is not applicable to a warehouse building due to the size and shape of the project site and the resulting size and orientation of the proposed industrial building.
25. Provide grass paving, tree shading, or reflective surface for unshaded parking lot areas, driveways, or fire lanes that reduce standard black asphalt paving by 10% or more.	**A Portion of the Measure is Included.** Tree shading of parking areas is a requirement of all projects and is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-26. Grass paving is not practical in the City's climate and to date not accepted by the Fire Prevention Bureau

Suggested Mitigation Measure	Response
	in addition heavy trucks cannot park on a grass surface.
26. Electrical outlets shall be installed on the exterior walls of all residential and commercial buildings (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.	**Incorporated.** The suggested mitigation measure has been added to reduce air quality emissions as a bulleted item to **Mitigation Measure 4.2.6.3A**.
27. Prohibit gas powered landscape maintenance equipment within residential, commercial, and mixed-use developments. Require landscape maintenance companies to use battery powered or electric equipment **or** contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.	**Incorporated.** The suggested mitigation measure has been added to reduce greenhouse gas emissions as a bulleted item to **Mitigation Measure 4.2.6.3A**.
28. Provide a complimentary cordless electric lawnmower to each residential buyer.	**Not Included.** As stated, the suggested mitigation measure applies to home buyers and is therefore inappropriate.
29. Implement parking cash-out program for non-driving employees.	**Included.** A similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
30. Require each user to establish a carpool/vanpool program.	**Included.** To the extent feasible, this suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
31. Create a car sharing program within the planned community.	**Not Included.** The suggested mitigation measure applies to a planned community and is therefore inappropriate.
32. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.*	**Not Included.** The suggested mitigation measure applies to a residential neighborhood and is therefore inappropriate.
33. Provide preferential parking for carpool/vanpool vehicles.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
34. Provide subsidies or incentives to employees who use public transit or carpooling, including preferential parking.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
35. Provide secure, weather-protected bicycle parking for employees.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
36. Provide direct, safe, attractive pedestrian access from project to transit stops and adjacent development.	**Not Included.** Pedestrian access to and from the project will take place from the adjacent streets on associated sidewalks that are already provided in the area.
37. Provide direct safe, direct bicycle access to adjacent bicycle routes.	**Not Included.** Bicycle access from the project will take place to and from the project site on the adjacent streets which already exist in the project area.
38. Provide showers and lockers for employees	**Included.** This suggested mitigation measure is already

Suggested Mitigation Measure	Response
bicycling or walking to work.	included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-28.
39. Short-term bicycle parking for retail customers and other non-commute trips.	**Not Included.** As stated, the suggested mitigation measure applies to a retail uses and is therefore inappropriate.
40. Connect bicycle lanes/paths to city-wide network.	**Not Included.** The suggested mitigation measure applies citywide bicycle planning, and is therefore inapplicable.
41. Design and locate buildings to facilitate transit access, e.g., locate building entrances near transit stops, eliminate building setbacks, etc.	**Included as a Part of Site Design**. The project site design includes a bus bay along the site's Perris frontage.
42. Construct transit facilities such as bus turnouts/bus bulbs, benches, shelters, etc.	**Included as a Part of Site Design.** The project site design includes a bus bay along the site's Perris frontage.
43. Provide a display case or kiosk displaying transportation information in a prominent area accessible to employees or residents.	**Incorporated** The suggested mitigation measure has been incorporated as suggested in the Errata to the Final EIR as a bullet to **Mitigation Measure 4.2.6.3A**.
44. Provide shuttle service to food service establishments/commercial areas.	**Not Included.** Warehouse workers tend bring their own lunch because they take a limited lunch break. For this reason, the suggested measure will result in additional vehicular emission as compared to without the suggested measure. Thus, this suggested measure is not warranted.
45. Provide shuttle service to transit stations/multimodal centers.	**Not Included.** The suggested mitigation measure has not been included. The project site design includes a bus bay along the site's Perris frontage. In addition
46. Provide on-site child care or contribute to off-site child care within walking distance.	**Not Included.** The suggested mitigation measure applies to areas with high number of employment and is therefore inapplicable.
47. Implement a compressed workweek schedule.	**Not Included.** The suggested mitigation measure is inapplicable for a high-cube logistics warehouse operation.
48. Implement home-based telecommunicating program, alternate work schedules, and satellite work centers.	**Not Included.** The suggested mitigation measure is inapplicable for a high-cube logistics warehouse operation.
49. All buildings shall be constructed to LEED Platinum standards.	**Not Included.** The process of obtaining a LEED rating of any level (LEED ratings levels are Certified, Silver, Gold, and Platinum, with Platinum being the highest) is not mitigation. However, the specific green building features that are part of the LEED rating equation can reduce air pollution and greenhouse gas emissions impacts by minimizing and reducing the quantity of emissions. Mitigation Measure 4.2.6.3.A in the Draft EIR prescribes a performance standard requiring a 20% improvement in energy efficiency (over and above the 2008 CBC) for the building and lists suggested measures that can be included in the building's design to obtain this improvement in energy efficiency.
50. Design buildings for passive heating and cooling and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.	**Not Included.** The suggested mitigation measure is inapplicable for a high-cube logistics warehouse operation.

Suggested Mitigation Measure	Response
51. Construct photovoltaic solar or alternative renewable energy sources sufficient to provide 100% of all electrical usage for the entire Project.	**Included.** A similar mitigation measure is provided in **Mitigation Measure 4.2.6.3A** in the Final EIR Errata. It reads as follows: "The project shall install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs."
52. Install an ozone destruction catalyst on all air conditioning systems.	**Not Included.** The suggested mitigation measures is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, and technological factors and is infeasible.
53. Construct renewable energy sources sufficient to offset the equivalent of 100% of all greenhouse gas emissions from mobile sources (internal combustion engines) for the entire Project.	**Not Included.** The suggested mitigation measure includes implementing carbon offsets in an amount equivalent to 100% of all project mobile source greenhouse gas emission. See Response to Comment E-54. This suggested mitigation measure is not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, and technological factors and is infeasible.
54. Purchase only green/ renewable power from the electric company.	**Included.** A similar mitigation measure is provided in **Mitigation Measure 4.2.6.3A** in the Final EIR Errata. It reads as follows: "The project shall install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs."
55. Install solar water heating systems to generate all hot water requirements.	**Included.** To the extent feasible, this suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-26.

Response to Comment D-46. As indicated in the Draft EIR (Section 4.2.5.1, Air Quality Plan Management Plan Consistency, pages 4.2-14 and 4.2-15), the project is consistent with the City's General Plan and zoning. Therefore, regional planning agencies, including SCAG and the SCAQMD, have already accounted for future industrial use on the proposed project site as part of the land use projections contained in the AQMP and other regional planning documents/programs (i.e., Regional Transportation Plan, etc). Implementation of the AQMP and the modified project-related mitigation measures will help to improve air quality levels in the future. Since the proposed project will contribute to full attainment of national and state ambient air quality standards, future cumulative impacts associated with the proposed and cumulative projects will not make a significant contribution to cumulatively considerable air quality impacts in the region. For clarification purposes, Section 4.2.7.1 Short-Term Air Quality Impacts on page 4.2-25 of the Draft EIR has been modified as shown below and as indicated in Section 3.0 Errata in the Final EIR:

Draft EIR, Section 4.2.7.1 Short-Term Air Quality Impacts, Page 4.2-25

4.2.7.1 Short-Term Air Quality Impacts

The cumulative area for air quality impacts is the Basin. The implementation of the project would contribute criteria pollutants to the area during project construction. A number of individual projects in the area may be under construction simultaneously with the proposed project. Depending on construction schedules and actual implementation of projects in the area, generation of fugitive dust and pollutant emissions during construction would result in substantial short-term increases in air pollutants. However, each project would be required to comply with the SCAQMD's standard construction measures. In addition, implementation of the AQMP will result in improved air quality levels in the future and full attainment of national and state ambient air quality standards, resulting in less than significant cumulative impacts from all short-term and long-term air pollution sources. Therefore, cumulative impacts associated with short-term air quality impacts would be less than significant.

Response to Comment D-47. The commentor states that the biological report that was prepared for the project is outdated and limited in survey coverage, concluding that the EIR fails as an informational document. As indicated in *CEQA Guidelines*, Section 15151, "… an EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. … The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure."

The August 2010 biological report *General Habitat Assessment, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California*, Ecological Sciences, Inc., August 1, 2010, referenced in August 2011 Initial Study and the April 2012 Draft EIR is one of several biological studies that have been conducted on the project site and vicinity. While the August 2010 Initial Study and April 2012 Draft EIR incorporated portions of the 2007 biological resource reports (refer to Response to Comment D-3 for a list of all biological technical reports) in describing site conditions, the environmental documents also included substantial additional biological survey data that was collected subsequent to the 2007 biological reports. In fact, additional surveys for burrowing owl, special status plant species, and wetland determination were conducted on the project site by the applicant's biologist in August 2009 and covered the entire project site. This data was revisited in August 2010 and confirmed as still valid. Biological survey reports often have a limited window within which the stated conclusions are considered valid. However, it must be emphasized that the conditions described in the various biological resource reports were verified and updated where necessary during the environmental process. Therefore, contrary to the commentor's opinion, the collective body of survey data for the project site is current, which accounts for the identification and full disclosure of any biological resources of concern on the project site.

2.7.1.1 **Response to Comment D-48.** The Draft EIR (Section 2.5 Effects Found Not to be Significant, 2.5.3 Cultural Resources, pages 2-12 – 2-13) did find that the proposed project would have a less than significant impact on paleontological resources (fossils) with the implementation of Mitigation Measure CUL-1. This determination was based on the Phase I Cultural Resources Assessment and Paleontological Records Review prepared for the proposed project. In that study it was determined that the site has a high potential to contain significant fossil resources due to the presence of early to middle Pleistocene alluvial fan deposits. These resources are the fossilized biotic remains of ancient environments valued for the information they yield about the history of the earth and its past ecological settings.

These resources have the potential for being unearthed and damaged during grading and construction activities and are estimated to lie at approximately 4 feet below ground surface. Construction and grading of the proposed project site will result in soil disturbance below 4 feet, which may unearth previously undetected subsurface paleontological resources. Mitigation Measure CUL-1 has been identified to reduce the significance of paleontological resource impacts.

Response to Comment D-49. The commentor is correct the mitigation measure does state that there would be a discontinuation of monitoring once maximum depth of excavation is met. If there is no excavation of soils there would not be disturbance of fossils (if they are on-site); therefore, why would monitoring be required. It is not the intent of CEQA to excavate the entire site below 4 feet in the case of this project to find fossils if they are there. If construction excavation is only going to a maximum depth of 10 feet and no fossils are found 10 feet below ground surface it can be assumed that the fossils are not within the first 10 feet below ground surface. With the deletion, the monitoring will continue below 4 feet. For clarification purposes that sentence of the Mitigation Measure CUL-1 has been deleted as indicated in Section 3.0 Errata in the Final EIR.

Draft EIR, Section 2.5.3 Cultural Resources, Page 2-13.

Mitigation Measure CUL-1: Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. ~~If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued.~~ In the event fossiliferous deposits are encountered, the following measures shall be implemented:

- Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources.
- Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored.
  - ~~If too few fossil remains are found after 50 percent of the planned for earthmoving has been completed, monitoring can be reduced or discontinued in those areas at the project paleontologist's direction.~~
  - Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.
  - Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities.

- Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources.

Response to Comment D-50. The City disagrees with the commentor. Mitigation Measure CUL-1 clearly states **"...***Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates and identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage."* Paleontologists are professional scientists and their salvaging efforts would not destroy fossils. The paleontologist's intent and that of the mitigation measure is for construction to stop so the paleontologist can recover the fossil(s) to identify and curate specimens into a professional, fully accredited museum repository with permanent retrievable storage.

Response to Comment D-51. In response to the commentor's comment that portion of Mitigation Measure CUL-1 has been deleted, refer to Response to Comment D-49.

Response to Comment D-52. There is an inherent misunderstanding as to the meaning of archeological and historic resources verses paleontological resources the definition of which is a follows:

Archaeology studies "human cultures" through the recovery, documentation, and analysis of material remains and environmental data, including architecture, artifacts, biofacts, human remains, and landscapes. The main goal of archaeology is to create the most thorough understanding of how and why both historical and prehistoric people lived, to understand the evolution of human society and civilizations, and to use knowledge of ancestors' history to discover insights into modern-day societies.[1]

An **historic resource** is building, structure, site, district, or object which is significant in American history, architecture, archaeology, engineering, and culture.[2]

Paleontology is the scientific study of life forms that existed in the earth's distant past as revealed though the examination of fossils of plants, animals, and other organisms. Included is the study of body "fossils", tracks (ichnites), burrows, cast-off parts, fossilized feces (coprolites), palynomorphs (tiny organic particle of a size between five and 500 micrometers), and chemical residues.[3]

Objective 7.6 and Policies 7.6.1 and 7.6.2 of the City's General Plan are referring to historic and archaeological resources not paleontological resources. As far as General Plan Program 9.7.3 and 7-6, a Phase I Cultural Resources Assessment and Paleontological Records Review (refer to Response to Comment D-49) was prepared for the proposed project that determined that the site has a high potential to contain significant fossil resources due to the presence of early to middle Pleistocene alluvial fan deposits. As a result the Draft EIR includes Mitigation Measure CUL-1 to ensure that there paleontological resources are protected. The City disagrees with the commentor in that the Draft EIR does include feasible enforceable mitigation. To ensure monitoring and enforcement, Mitigation Measure CUL-1 is included in the MMRP (Final EIR Section 4.0).

3 http://www.newworldencyclopedia.org/entry/Paleontology, website accessed June 5, 2012.

Response to Comment D-53. The import of fill (220,000 cubic yards) to the project site was considered in the evaluation of the proposed project in the Draft EIR in Sections 4.2 (Air Quality, page 4.2-20), 4.3 (Greenhouse Gas Emissions, calculated using same model as used for Air Quality), and 4.4 (Noise, page 4.4-18). The 80,000 cubic yards of fill that is currently on-site is considered the baseline (existing on-site conditions) and this fill was imported to the project site as part of a previously approved stockpile permit (page 3-3) that predated the proposed project. Traffic impacts associated with the soil import operations were not addressed because the operations would result in negligible effects on the local and regional circulation systems due to low trip generation anticipated for the haul trucks and the temporary in nature of the activity.

Response to Comment D-54. Mitigation Measure GEO-2 has been revised to eliminate any perception of vagueness. To ensure monitoring and enforcement, revised Mitigation Measure GEO-2 is included in the MMRP (Final EIR Section 4.0).
Draft EIR, Section 2.4.4 Geology and Soils, Page 2-16.

> **Mitigation Measure GEO-2:** Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be ~~reviewed and considered~~ implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties ~~to determine~~ in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans.

Response to Comment D-55. This comment is only a statement of opinion. GHG plans, policies, and regulations are still overall vague and difficult to analyze compliance with. While VMT is a factor of GHG emissions, it is not clear how that relates to GHG plans, policies and regulations. As stated in CEQA Guidelines section 15151, "*An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.*" The EIR meets the standards of adequacy of an EIR in accordance with CEQA Guidelines section 15151.

Response to Comment D-56. New development projects derive (most of) their energy from the existing energy grids (mainly electricity and natural gas), so the consumption from one individual development project cannot determine the percentage of energy production/generation from the entire energy grid, or what percentage comes from renewable sources. The achievement of renewable energy goals must be set and achieved at a regional or state level, and cannot be assigned to any individual project. The proposed project is designed to allow onsite solar (photovoltaic) electrical generation, but there is no specific end user defined yet. In addition, a number of changes have been made to the recommended Mitigation Measure 4.2.6.3A that addresses greenhouse gases and sustainability. Improvement in project operations that reduces energy consumption results in lowered GHG emissions from area power production facilities. The discussion that follows Table 4.3.B in Draft EIR Section 4.3.5.1 Greenhouse Gas Plan, Policy, and Regulation Consistency supports the EIR's conclusion of consistency.

Response to Comment D-57. The cited SCAQMD tiered thresholds are still only guidance as proposed draft thresholds and do not carry the force of law or adopted regulations. In addition, the commentor has misinterpreted the application of the 5-tier review system recommended by the SCAQMD. The cited thresholds indicate when a particular project under evaluation should move to the next stage of the evaluation (i.e., the next tier) – they are not thresholds against which to specifically determine a significant impact. In addition, as described in the Draft EIR, the greenhouse gas emissions produced by the project do not in themselves represent a project-level significant impact related to greenhouse gases. That conclusion is consistent with guidance provided by CARB and the SCAQMD. The EIR does correctly conclude that the proposed project would make a significant contribution to cumulatively considerable greenhouse gas impacts, even with implementation of the recommended mitigation, including Mitigation Measure 4.2.6.3A as revised in Responses to Comments D-38 and D-39 in this document.

Response to Comment D-58. A more precise water conservation strategy cannot be described at this point in the project development. This Mitigation Measure is included so that some sort of water conservation strategy will be included, when appropriate (i.e., prior to issuance of occupancy permits).

Response to Comment D-59. This comment is only a statement of fact, requiring no response. As there are no quantifiable reductions supplied, there is no reason not to specify these measures.

Response to Comment D-60. This comment is a statement of fact and is noted. No response is required.

Response to Comment D-61. The commentor incorrectly asserts that impacts associated with transport and storage of hazardous materials cannot be mitigated through applicable laws because the tenant is not known. The comment appears to suggest that a future tenant may not abide by applicable laws that regulate hazardous materials. The City assumes, as a reasonable and legitimate part of the CEQA process, that any future tenant of the project building is required to abide by all state and local laws that regulate the transport, use, and storage of hazardous materials. In addition, this project involves warehousing, not heavy or light industrial uses, and so the potential for onsite uses to handle, store, or transport materials that would be hazardous to public health or safety are relatively low, but would ultimately depend on the end user selected to ultimately occupy the project building.

Response to Comment D-62. The commentor states that the EIR fails to undertake an evaluation of water quality impacts beyond the cursory review done for the Environmental Assessment (i.e. Initial Study). The City disagrees with this statement. As identified in the Draft EIR, Section 2.5.6 (Hydrology and Water Quality, page 2-19 – 2-25), the analysis provides a detailed discussion regarding construction and operational activities in relation to water quality and recommends mitigation measures that would ensure that any water pollutants generated during these phases are treated appropriately. The analysis also describes in detail the proposed drainage features and drainage paths that would be constructed on the project site as well as any flooding impacts that the site would be prone to. These discussions and conclusions are based on a project-specific preliminary water quality management plan and hydrology/hydraulic analysis[1]. The water quality analysis was provided as part of the Initial Study subject to public review and comment as part of the NOP process. Based on the input received from the NOP, no additional concerns regarding water quality were identified by

---

Bebensee, R.C.E., March 27, 2009, and *Preliminary Water Quality Management Plan, for PA09-0004 VIP Moreno Valley, SWC Perris Boulevard and Grove View Road*, Robert A. Bebensee, R.C.E., July 24, 2009.

MV00170217

an interested member of the public, including the commentor. While the commentor opines that the evaluation of water quality impacts is cursory, the commentor does not provide any meaningful input as to how the analysis can be further evaluated. The water quality analysis included in the Initial Study and Draft EIR represents a good faith effort at full disclosure and no further response is required.

Response to Comment D-63. Section 2.5.6 (Hydrology and Water Quality) of the Draft EIR discussed potential drainage-related impacts resulting from development of the proposed project. As reflected therein, as well as the detailed preliminary Hydrologic and Hydraulic Analysis included as Appendix B-8 *(Preliminary Hydrology Report and Hydraulic Analysis for PA09-004, VIP Moreno Valley, SWC Perris Boulevard and Grove View Road,* Robert A. Bebensee, R.C.E., March 27, 2009) to the Draft EIR, development of the proposed project would result in the construction of impermeable surfaces that will alter the natural drainage of the project site.

As stated in Draft EIR page 2-24, "…storm flows generated from the northerly portion of the proposed building and truck court would be collected by a series of drop inlet catch basins. Storm water runoff generated on site would be routed to three Austin sand filters and pre-treatment hydro-dynamic clarifiers that are intended to remove and reduce the amount of oils, sediment and trash from the storm water. The treated water from these sand filters is pumped into an adjacent on-site storm drain. The on-site storm drain system has been designed to accept a full 100-year storm event and flows would ultimately be routed to the Perris Valley ADP Lateral B-1 in Perris Boulevard that connects to the Perris Valley Storm Drain Lateral B channel. Storm flows generated from the westerly side of the proposed building would be collected by a drop inlet catch basin and routed by pipe to a landscaped swale that would be located along the southerly portion of the property. In the event that the landscape swale receives excess flows, the excess flows would be then routed to a second drop inlet catch basin. From the second drop inlet catch basin, flows would continue to an off-site catch basin and ultimately be routed to the Perris Valley ADP Lateral B-3 in Indian Street, which connects to the Perris Valley Storm Drain Lateral B channel. Storm water runoff generated from the easterly side of the building would be collected by a drop inlet catch basin and route via pipe to a hydro-dynamic clarifier then to an Austin sand filter located in the southeasterly corner of the project site. In the event that the clarifier and sand filter receive excess storm flows, these excess storm flows would be routed to an off-site catch basin and ultimately routed to the Perris Valley ADP Lateral B-1 in Perris Boulevard, which connects to the Perris Valley Storm Drain Lateral B channel. Storm flows generated from would also be routed to a landscaped swale running along the southerly portion of the project site. Flows would then be routed to an Austin sand filter located near the center of the site and ultimately routed to four existing 36-inch diameter reinforced concrete pipes (RCPs) that connect to Lateral B of the Perris Valley Channel. The Austin sand filter located in the southeasterly corner of the project site would also accept stormwater flows from the project site. In the event that flows are in excess of what the sand filter can handle, the excess flows would be directed back to the southerly landscaped swale, and ultimately to an existing 30-inch diameter RCP that connects to Lateral B of the Perris Valley Channel."

The purpose of including Mitigation Measure HYD-05 was to ensure that the preliminary Hydrologic and Hydraulic Analysis was finalized by the City's Engineer and that the calculations contained in the analysis met City requirements. The Draft EIR does not improperly defer mitigation in this regard as an existing preliminary Hydrologic and Hydraulic Analysis has already been prepared for the project. Furthermore, the finalization of hydraulic calculations is a requirement of all projects in the City. Therefore, the inclusion of this requirement as Mitigation Measure HYD-05 is designed to track both the standard requirements and mitigation measures as part of the project's MMRP. Mitigation Measure HYD-05 has been revised accordingly to clarify the finalization of the Hydrologic and Hydraulic Analysis. No further response is required.

Draft EIR, Section 2.5.6 Hydrology and Water Quality Hydrology, Page. 2-24:

> To reduce the flows to below or equal to pre-development conditions, the anticipated on-site flows would be routed to the water quality features such as vegetated swales, clarifiers, and sand filters to reduce flows leaving the site to pre-development flow rates. While the increase in impervious surfaces attributable to the proposed project would contribute to a greater volume and higher velocity of storm water flows, the proposed project's drainage system would accept and accommodate runoff that would result from project construction at or below pre-project conditions. Therefore, the post-development flows generated on the project site would not exceed the capacity of the planned storm water drainage systems. Although adherence to the City's drainage requirements, which includes the preparation of drainage sizing calculations, is required of all applicable development within the City, the incorporation of this requirement as **Mitigation Measure HYD-05** is designed to track both standard requirements and mitigation measures as part of the project's MMRP. ~~To ensure that long-term drainage capacity issues are reduced to a less than significant level, **Mitigation Measure HYD-05** has been identified.~~ With adherence to this mitigation measure, impacts associated with this issue are less than significant.
>
> ***Mitigation Measure HYD-05:*** *Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley, a Final Hydrologic and Hydraulic Analysis based on the City's existing drainage requirements.* ~~*submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed project site are less than or equal to pre-development flows.*~~

Response to Comment D-64. The commentor opines that the project would conflict with an applicable habitat conservation plan or natural community conservation yet does not provide any specific comment as to how the project does conflict. As stated in *CEQA Guidelines,* Section 15151, "… an evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate." The comment posed is identified as being part of the land use discussion. As identified in Draft EIR Section 2.5.7 Land Use, page 2-25 the discussion of the project's consistency with applicable habitat conservation plans is provided in Draft EIR Section 2.5.2, Biological Resources, pages 2-8 – 2-12. The applicable habitat conservation plan for the area is the Western Riverside County MSHCP.

As stated on Draft EIR Section 2.5.2, Biological Resources page. 2-9, "*The MSHCP defines two distinct consistency processes for development projects based on their location within the MSHCP Plan Area, with separate processes for projects located outside of Criteria Areas and those within a Criteria Area. Through implementation of these requirements, development projects are found to be consistent with the MSHCP, and impacts to covered species are considered less than significant. The project site is not located within an MSHCP Criteria Area, but is located in an area requiring habitat assessments for burrowing owl (Athene cunicularia), five Narrow Endemic Plant Species (NEPS), and nine Criteria Area Plant Species (CAPS). A Jurisdictional Delineation is required to assess potential jurisdiction of the ditch running north/south through the center of the project site.*"

Burrowing owls or their sign (pellets, fecal material, or prey remains) were not observed during the habitat assessment surveys (February 2007) or focused surveys (August 2009) conducted on site. It

is unlikely that burrowing owls would be located on site as burrowing owls tend to avoid heavily disked areas because of potential burrows occlude/collapse. However, in the event that burrowing owls are found on site, the inclusion of the Mitigation Measures BIO-1 through BIO-4 (which requires pre-construction surveys for burrowing owl), would fulfill MSHCP requirements. The fulfillment of MSHCP requirements would enable the project to be consistent with the Riverside County MSHCP.

Based on the information contained in the Draft EIR, the five Narrow Endemic Plant Species (NEPS) and nine Criteria Area Plant Species (CAPS) were not observed during the general survey (February 2007) and focused surveys (May, June, and July 2009) conducted on site. Overall, the project site lacks suitable habitat for these species due to historic agricultural activities. Because of the absence of members of the species and suitable habitat, a less than significant impact to special status plants would occur. Since the project would not impact any of the plants identified in the MSHCP, the project is consistent with this component.

The potential for agency jurisdiction of the on-site drainage ditch was assessed as part of the previously referenced Jurisdictional Survey and MSHCP Riparian/Riverine/Vernal Pools Evaluation prepared for the project. The ditch does not meet the three-parameter test for jurisdiction (vegetation, hydrology, and soils). Therefore, the project would not impact jurisdictional waters and would be consistent with the requirements identified in the MSHCP for this component. Based on the analysis contained in the Draft EIR, the project is consistent with the MSHCP, is supported by project specific biological data and survey work, and represents a good faith effort at full disclosure. No further response is required.

Response to Comment D-65. The 3 dBA increase was not identified in the noise impact analysis as a threshold. Rather, it was stated that "audible impacts that refer to increases in noise levels noticeable to humans generally refer to a change of 3 dB or greater, since this level has been found to be barely perceptible in exterior environment;" For noise level changes that are not perceptible by the human ear, they would not cause any audible change and would therefore not result in any significant noise impacts.

Response to Comment D-66. Noise standards identified in the City's Municipal Code are used to determine if projected noise levels from the proposed on-site operations would result in any significant stationary sources noise impacts on sensitive uses in the project vicinity. Failing to comply with these noise standards would cause project operations, after project implementation, to violate the City's Municipal Code. Therefore, it is appropriate to use the City's Municipal Code noise standards to evaluate potential on-site noise-generating operations.

Response to Comment D-67. The City's noise standards in terms of the 24-hour weighted Community Noise Equivalent Level (CNEL), identified in the General Plan Noise Element, are applicable for land use planning purposes to avoid placing noise-sensitive land uses within the high noise impact zones. Use of these noise standards are adequate when proposing noise-sensitive land uses such as residences near airport, railroad tracks, or heavily traveled highways/freeways. Noise standards included in the City's Municipal Code are typically used for enforcement purposes to determine if noise associated with a stationary source would exceed or violate the City's noise standards from stationary sources. They were used in the noise impact analysis (Draft EIR Section 4.4.2.1 City of Moreno Valley General Plan Policies, page 4.4-5) to determine the potential impacts from on-site operations.

Response to Comment D-68. Use of "hard site" is appropriate in an urban area where the majority of the ground surface is paved, and most sound energy is reflected back up in the air. In suburban or rural areas where almost half of the ground surface between the traffic and the receptor location is either vacant land or planted with landscaping vegetation, the use of "soft site" is more appropriate.

Nevertheless, the choice of hard site or soft site for ground reflection only affects the potential noise level on the project site. Project-related changes would be the same under both scenarios. On off-site land uses, the 2013 with project traffic noise levels showed that project-related traffic noise level increases would be 0.8 dBA or less. This range of traffic noise level changes in an outdoor environment gradually over a time period would not be perceptible by the human ear and would not result in any significant noise impacts. As the proposed land use is not noise-sensitive, the use of soft site or hard site for noise reflection would not have any effect on the project findings.

Response to Comment D-69. The proposed project would generate approximately 2,731 vehicular trips a day, and about half of these vehicles are trucks. These project-related vehicles would be 7.5 to 15 percent of the projected 2012 cumulative traffic volumes along roadway segments that would be used by these vehicles. An increase of 7.5 to 15 percent vehicles along these roadway segments would result in an increase of approximately 0.3 to 0.6 dBA on these roads. Even though the proposed project is a distribution facility with higher truck percentage, the change in overall vehicle mix along these affected roadway segments would not be substantial. The resulting traffic noise level changes or increases on off-site land uses would remain small and less than significant. Since the proposed on-site land use is not considered noise-sensitive, and the project-related traffic noise level increases would be the same under both scenarios, this factor would not affect the findings of the noise impact analysis.

Response to Comment D-70. As stated in the Responses to Comments D-65 and D-68, project-related traffic noise level increases would be small and not perceptible by the human ear. The four study roadway segments that have noise levels that already exceed the City's noise standards, with or without the proposed project, have pre-existing conditions that are not a consequence of the proposed project, and therefore, the proposed project is not responsible for the noise level existing noise exceedance on those roadway segments.

Response to Comment D-71. The noise impact analysis for the proposed project (*Noise Impact Analysis VIP Moreno Valley*, LSA Associates, Inc., March 2012) evaluated the long-term operational traffic noise impact in terms of CNEL and the on-site operations noise impact comparing them to the City's Municipal Code noise standards. No exceedance or violation of the noise standards was found and no significant long-term noise impacts would occur. The project site is surrounded by vacant land which is planned for light/industrial uses and commercial/light industrial uses to the south or other existing non-noise-sensitive industrial uses to the north, east and west. The City's Municipal Code states that the noise standards shall apply "*when measured at a distance of 200 feet or more from the real property line of the source of the sound if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property*." In this case, evaluating the potential noise levels at the property line of the nearest existing noise-sensitive land uses (i.e., residences) that are at a distance of 200 feet or more would adequately determine the project's potential noise impacts. Future noise-sensitive land uses, if proposed in the vicinity of the project site, will be required to mitigate noise associated with all neighboring sources, including the proposed project.

Response to Comment D-72. As stated in the Response to Comment D-71, the project site is surrounded by vacant land that is planned for light industrial/business park in the City of Moreno Valley and to the south in the City of Perris for light industrial/commercial uses or other non-noise-sensitive land uses (refer to Figure in the Draft EIR Section 1.0 page 1-3). These land uses that are directly adjacent to the project would not be significantly affected by the project noise. Noise from on-site operations, including loading/unloading and onsite maneuvering, have been adequately evaluated at the nearest noise-sensitive land uses and no significant noise impacts were identified. Truck noise from trucks driving on public streets is not regulated by the local governments (city or county).

MV00170221

Response to Comment D-73. As stated in the Response to Comment D-71, the noise impact analysis evaluated the traffic noise impact in terms of CNEL and the on-site operations were compared to the City's Municipal Code noise standards. No exceedance or violation of the noise standards was found and no significant long-term noise impacts would occur. All potential noise impact sources were identified and properly evaluated. Please refer to Appendix F (*Noise Impact Analysis VIP Moreno Valley,* LSA Associates, Inc., March 2012) of the Draft EIR for more detailed analysis and discussion on these impacts.

Response to Comment D-74. The noise levels obtained from the 1987 edition of Noise Control for Buildings and Manufacturing Plants (Bolt, Beranek & Newman, 1987) represent a conservative analysis for construction equipment. Because of technology advancement, most current day construction equipment emits lower noise levels compared to the 1987 version. In addition, the project site is surrounded by vacant land or other non-noise-sensitive land uses such as industrial uses. Noise from the on-site construction activity would not result in any significant impacts to adjacent uses (Draft EIR, Section 4.4.5.4 Long-Term Operational Noise Impacts. Page 4.4-13).

Response to Comment D-75. As demonstrated in the Responses to Comments D-65 through D-74, no significant noise impacts would occur with the implementation of the mitigation measures for on-site construction and in addition the requirement of the applicant/contractor to follow the City's Municipal Code Mitigation is provided to reduce construction impacts as well. The land uses that are directly adjacent to the project site are not noise-sensitive and would not be significantly affected by project construction noise. Potential construction noise impacts on the nearest noise-sensitive receptor locations, i.e., existing residences approximately 1,000 feet to the north of the project site, have been adequately evaluated and no significant noise impacts were identified.

It should be noted that the *Moreno Valley Municipal Code* in Chapter 11.80.030 Prohibited Acts (Title 11). Sound level limits are established for both continuous and impulsive (momentary) sounds. The City prohibits grading activities between the hours of 8:00 p.m. and 7:00 a.m. and prohibits construction activities from 8:00 p.m. to 6:00 a.m. during the week and between 8:00 p.m. and 7:00 a.m. on weekends and holidays.

The City's Municipal Code, Section 8.14.040.E, specifies the hours of any construction within the City to occur only as follows: Monday through Friday (except for holidays that occur on weekdays), 6:00 a.m. to 8:00 p.m.; weekends and holidays (as observed by the City and described in Chapter 2.55 of the Municipal Code), 7:00 a.m. to 8:00 p.m., unless written approval is obtained from the City building official or City engineer. According to the City's Municipal Code Ordinance 8.21.050, grading permit requirements, the hours are limited to between 7 am and 6 pm weekdays and 8 am to 4 pm on weekends and holidays.

In addition the Draft EIR, page 4.4-17 states "*The nearest noise-sensitive receptor locations to the project site are existing residences approximately 1,000 feet to the north. These nearest residents may be subject to short-term, intermittent, maximum noise reaching 65 dBA L_{max}, generated by construction activities on the project site. The ambient noise associated with vehicular traffic and industrial uses in the project area would mask the majority of the construction noise from the project site. No significant construction noise impacts would occur if construction of the proposed project would occur within the permitted hours of 6:00 a.m. to 8:00 p.m. of any working day, and within the permitted hours of 7:00 a.m. and 8:00 p.m. on weekends and federal holidays. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures [Mitigation Measures 4.4.6A – 4.4.6D] have been identified to reduce the noise*

levels that would expose nearby sensitive receptors to noise levels in excess of the City's noise standards."

Response to Comment D-76. As demonstrated in the Responses to Comment D-74, no significant noise impacts would occur with the implementation of the mitigation measures for on-site construction. Therefore, it is not warranted to include these additional mitigation measures, because none of them would apply to this project.

Suggested Mitigation Measure	Response
1. Temporary noise barriers must be installed during project construction.	**Not required.** As indicated in the noise impact study, there are no noise-sensitive land uses in the immediate project neighborhood and no noise barriers would be required during project construction. The proposed project will comply with all mitigation measures identified and comply with applicable federal, State, and City guidelines.
2. Where technically feasible, utilize only electrical construction equipment.	**Not required.** As evaluated in the noise impact study, practical procedures will be taken for the onsite operations. There are no noise-sensitive land uses located in the immediate neighborhood of the project site. No noise impacts would occur.
3. During construction, the developer shall require that all contractors turn off all construction equipment and delivery vehicles when not in use and prohibit idling in excess of 3 minutes.	**Not required.** Construction equipment will be turned off when not in use. Idling for delivery vehicles will be limited to no more than 5 minutes per truck per trip per day, according to the requirements established by the California Air Resources Board.
4. Provide a "windows closed" condition requiring a means of mechanical ventilation (e.g. air conditioning) for all buildings.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operation noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
5. Provide upgraded windows with a minimum Sound Transmission Class (STC) rating of 34 for all buildings, and/or require the installation of double-paned windows.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
6. Keep new transportation facilities away from vibration sensitive areas.	**Not required, no nexus to the impact.** This comment does not apply to the project because no transportation facilities are being proposed.
7. When dealing with existing transportation facilities, obvious vibration causes, such as pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc., may be eliminated by resurfacing.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
8. Require the use of rubberized asphalt for construction of all roadways and parking areas.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
9. Maintain quality pavement conditions that are free of bumps, pot holes, pavement cracks, differential settlement in bridge approaches or individual pavement slabs, etc.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures

Suggested Mitigation Measure	Response
	are required.
10. Require resurfacing of roads.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
11. Ban heavy trucks near vibration sensitive uses.	**Not required, no nexus to the impact.** As indicated in the noise impact analysis, no significant operational noise impacts would occur for noise-sensitive land uses in the project vicinity. No mitigation measures are required.
12. Use alternate construction methods and tools to reduce construction vibrations. Examples are predrilling of pile holes, avoiding cracking and seating methods for resurfacing concrete pavements near vibration sensitive areas, using rubber tired as opposed to tracked vehicles, placing haul roads away from vibration sensitive areas.	**Not required.** There are no noise sensitive land uses in the immediate project vicinity. Noise and vibration associated with the proposed project would not result in any significant impacts to adjacent uses.
13. Scheduling construction activities (particularly pile driving) for times when it does not interfere with vibration sensitive operations (e.g. night time).	**Not required.** There are no noise sensitive land uses in the immediate project vicinity. Noise and vibration associated with the proposed project would not result in any significant impacts to adjacent uses.

Response to Comment D-77. Refer to Responses to Comments D-74 and D-76, no significant noise impacts would occur with the implementation of the mitigation measures for on-site construction. Mitigation Measure 4.4.6.1D "*During all project site construction activities, the construction contractor shall limit all construction-related activities that would result in high noise levels to between the hours of 6:00 a.m. and 8:00 p.m. on weekdays and between the hours of 7:00 a.m. to 8:00 p.m. on weekends and holidays, unless written approval is obtained from the City Building Official or City Engineer. For grading activity, the hours are limited to between 7:00 a.m. and 6:00 p.m. weekdays and 8:00 a.m. to 4:00 p.m. on weekends and holidays,"* is provided to ensure that the Municipal Code is implemented.

Response to Comment D-78. As demonstrated in the noise impact analysis, project-related traffic noise increases in the project vicinity would be small and not perceptible by the human ear (Draft EIR, Section 4.4.5.3 Long-Term Traffic Noise Impacts, page 4.4-10). Project on-site operational noise impacts were also found to be less than significant (Draft EIR Section 4.4.5.4 Long-Term Operational Noise Impacts, page 4.4-13). Since the projected 2013 traffic volumes include traffic trips from other cumulative projects in the project area, no significant project-related long term cumulative noise impacts would occur.

Response to Comment D-79. The commentor's referral to "traffic counts" is erroneous and is assumed he was referring to the "trip generation" of the project. The trip generation rates for High-Cube Warehouse were the modified National Association of Industrial and Office Properties (NAIOP) rates (based on a 2007 NAIOP letter summarizing the trip generation studies of 13 high-cube warehouses located in western Riverside County) that was approved by the City of Moreno Valley Transportation Engineering staff. The City's modified NAIOP rates are higher than the Institute of Transportation Engineers (ITE) *Trip Generation, 8th Edition* rates for High-Cube Warehouse, therefore the air pollution, greenhouse gas, and trip generation estimates for the proposed project are overstated resulting in a conservative analysis.

ITE *Trip Generation 8th Edition* is the standard used by City of Moreno Valley in determining project trip generation for new developments. When the initial version of the traffic study for the project was first prepared, the previous version, *7th Edition,* of *Trip Generation* was available. In the previous version, the high-cube warehouse category (land use 152) was not utilized because only p.m. peak hour data was available and the sample size was too small. Due to the lack of data with the high-cube warehouse rates, the City analyzed the 2007 NAIOP trip generation rate data and developed reasonable trip generation rates for high-cube warehouse reflecting a full standard deviation above the average rates disclosed in the 2007 NAIOP trip generation study. As stated above, the City's modified NAIOP rates are higher than the current ITE *Trip Generation 8th Edition* rates for high-cube warehouses. Further, the rate for High-Cube warehouse is dependent on the square footage of the building and not the number of dock doors or parking stalls.

Response to Comment D-80. The intersections analyzed in the EIR were based on discussion with City of Moreno Valley Transportation Engineering staff during the scoping process. Furthermore, intersections on Harley Knox Boulevard from Indian Street to Interstate 215 are not part of the 2010 Riverside County Congestion Management Program and were not included in the analysis. The traffic study did not include the intersection of Patterson Avenue/Harley Knox Boulevard in the analysis because project passenger vehicles and trucks will travel eastbound and westbound on Harley Knox Boulevard and would not make left- or right-hand turns to/from Patterson Avenue. For this reason, potential project impacts to the intersection were determined to be not substantial and the intersection was not included as a study intersection.

Caltrans requires analysis to a State highway facility if a project generates over 100 peak hour trips. The project generates over 100 peak hour trips at the Interstate 215/Harley Knox Boulevard interchange and was included in the Project's Traffic Impact Analysis. Project traffic at Cactus Avenue and Ramona Expressway are less than 100 peak hour trips and were not included in the Draft EIR. Based on the City of Moreno Valley Traffic Impact Analysis guidelines, a General Plan Build-out analysis was not required since the project did not propose a General Plan Amendment or Zone Change.

Response to Comment D-81. It appears the commentor is incorrectly stating that analysis of local intersections, local roadways, freeway mainline segments, and freeway merge/diverage areas as conducted in the EIR constitutes segmenting. The comment is therefore unclear and needs refinement to warrant a response.

Nonetheless, the traffic analysis conducted for the project examined project impacts on existing baseline conditions and year 2013 cumulative conditions. For the each time horizon, a.m and p.m. peak hour impacts were assessed based on a level of service analysis of local intersections, local roadways, freeway mainline segments, and freeway merge/diverage areas.

Response to Comment D-82. As stated in the Project TIA *(Traffic Study VIP Moreno Valley,* LSA Associates, Inc., April 9, 2012*)*, the payment of DIF and TUMF fees is considered the appropriate mechanism for the project to contribute to future roadway improvements, resulting in full and complete mitigation of project-specific impacts. The timing to use the TUMF and DIF fees is established through the capital improvement plan (CIP) overseen by the City, which uses traffic counts, trends, and review of traffic accidents to determine the project priority of the improvements. Project priority categories in the City's CIP include essential (start within 1 year), necessary (start within 1 to 3 years), desirable (start within 3 to 5 years), and deferrable (start within 5 to 10 years).

As stated in the Level of Significance After Mitigation following Mitigation Measures 4.5.6.1A and 4.5.6.1B (see page 4.5-19 of the Draft EIR), improvements to Perris Boulevard are out to bid to potential construction contractors, with construction of the improvement anticipated to finish in May of

MV00170225

2013. Page 4.5-19 of the of the Draft EIR also notes that these improvements to Perris Boulevard for the existing plus project condition are consistent with the City's General Plan and are included in the County's TUMF program. The Draft EIR goes on to note that a portion of the City's DIF is allocated toward funding improvements to the City's transportation system, and the specific improvements are based on the General Plan Circulation Element. For these reasons, the Draft EIR concluded that the project's impacts to affected roadway segments (Perris Boulevard) will be mitigated through payment of the City's DIF and the County's TUMF.

As stated in the Level of Significance After Mitigation following Mitigation Measures 4.5.6.2A (see page 4.5-27 of the of the Draft EIR), the improvements defined to maintain the applicable level of service standard at local intersections and roadways in the 2013 cumulative plus project condition will be built per the City's DIF and County's TUMF programs. Payment of these fees in accordance with Mitigation Measures 4.5.6.1A and 4.5.6.1B was therefore determined to be full and complete mitigation of project impacts to roadway segments and intersections in the 2013 cumulative plus project condition. The intersections and roadway segments on Perris Boulevard and Indian Street are included in the City of Moreno Valley's CIP and are planned to be funded by DIF and TUMF. The intersections and roadway segments on Harley Knox Boulevard are included in the City of Perris' "North Perris Road and Bridge Benefit District" and are also planned to be funded by DIF and TUMF. However, the Draft EIR notes that the necessary improvements to freeway segments are outside the City's jurisdiction and therefore the City has no control over when or how these improvements will be put in place, the impacts to freeways would remain significant and unavoidable until such improvements are built.

It should also be noted that the City also uses other funding sources for future roadway improvements such as Measure "A" (Fund 125), gas tax fund (Fund 121), SCAG Article 3 (SB 821 Grant Awards), proposition 42 replacement funds (Fund 224), CDBG (Fund 285), general city capital projects fund (Fund 412), and public works general capital projects fund (Fund 414). Furthermore, the Perris Boulevard widening project that is expected to begin construction in July 2012 is anticipated to be 100% paid for by TUMF funding (CIP 2012-2013). Improvements in the City that are covered by DIF funds in the CIP 2012-2013 include Cactus Avenue EB improvements/I-215 to Veterans Way, Cactus Avenue EB improvements/Veterans Way to Heacock Street, and Day Street Widening, Heacock Street/Perris Valley Storm Drain to Cactus Avenue, and Ironwood Avenue/Perris Boulevard to Nason Street.

The commentor assumes that all cumulative projects will be built by 2013 and therefore all roadway improvements recommended in the project TIA will be required by 2013. However, the cumulative (2013) scenario analyzed in the project's TIA analysis is a scenario required by the City and doesn't represent real world conditions where most cumulative projects won't be built by 2013 and therefore all improvements won't be required.

Response to Comment D-83. Please refer to the Response to Comment D-82.

Response to Comment D-84. Please refer to the Response to Comment D-82.

Response to Comment D-85. Please refer to the Response to Comment D-82.

Response to Comment D-86. Please refer to the Response to Comment D-82.

Response to Comment D-87. The commentor appears to be suggesting that, because the proposed project exceeds SCAQMD construction and operational emission thresholds, it cannot be consistent with SCAQMD's AQMP. The purpose of the daily thresholds is to provide benchmarks against which to examine a project's short-term (construction) and long-term (operational) air quality impacts as part

of the CEQA process. The purpose of the AQMP is to provide regulation and guidance for achieving federal and state criteria attainment status in the future. The daily thresholds and the AQMP therefore serve two separate and distinct purposes. The land uses proposed by this project are consistent with the local and regional plans that form the basis for the AQMP (i.e., the City's General Plan and SCAG's Regional Comprehensive Plan and Regional Transportation Plan). Therefore, the proposed project is consistent with the AQMP. However, the SCAQMD has also established daily thresholds for construction and operational air pollutant emissions that, if exceeded, represent a significant air quality impact under CEQA. As described in the project's air quality study and the EIR Section 4.2 Air Quality, the proposed project exceeds one or more daily thresholds for both construction and operations. Therefore, the project can be consistent with the AQMP as well as exceed daily thresholds for construction and operational air pollutant emissions. Also refer to Response to Comment D-46 for a discussion on the project's consistency with the AQMP.

Response to Comment D-88. The proposed project will create jobs, providing the opportunity for City of Moreno Valley residents to find employment close to their homes. Although the quantity of commute travel reduction is virtually impossible to calculate, the project will create the potential for reduction in commuting distances for employees that reside in the City or in other municipalities near the project site. Regarding traffic impacts, see Response to Comment D-83. The City has determined that payment of DIF and TUMF fees is considered the appropriate mechanism for the project to contribute to future roadway improvements, resulting in full and complete mitigation of project-specific impacts.

Response to Comment D-89. The commentor opines that the goal of "diversifying the region's economy" is not satisfied by "add[ing] to the City's portfolio of industrial services." As stated in *CEQA Guidelines,* Section 15151, "… an evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate." The commentor is selective in which part of the goal is focused on and fails to take the entirety of all the economy goals into consideration. The full goal from which "diversifying the region's economy" was pulled from is as follows:

"**Goal** Promote sustained economic health through diversifying the region's economy, strengthening local self-reliance and expanding competitiveness."

The EIR does not make the assertion that the addition of the project would diversify the region's economy. Furthermore, it appears that the goal is to promote sustained economic health through a three pronged approach – diversifying the region's economy, strengthening local self-reliance, and expanding competitiveness. As stated on Draft EIR page 5-10, "…*the proposed project would add to the City's portfolio of industrial services, which would enable the City to be more self-reliant through the provision of goods and services to residents within the City. Through the addition of the proposed project, the City would also expand its economic competitiveness with other areas in the region. Therefore, the proposed project is consistent with this policy.*"

These statements are supported by analysis contained in the Draft EIR. Specifically, the analysis contained in the Economy Chapter (Draft EIR page 5-10) identifies the number of jobs that would be created as part of the project and the balancing of the jobs to housing ratio in the City which generally would allow for the City to be more self-reliant. As identified in Table 2.C of the Draft EIR (Cumulative Projects List page 2-34), there are multiple warehousing projects within adjacent jurisdictions (e.g. City of Perris, City of Riverside, and County of Riverside). The addition of the proposed project would enable the City to offer a similar type of warehousing stock in comparison to other areas in the region.

Lastly, the commentor does not offer any specific detail as to how the analysis contained in this section is unsupported. The analysis contained in the Draft EIR represents a good faith effort at full disclosure and no further response is required.

Response to Comment D-90. The commentor states that Draft EIR fails to evaluate how the project is consistent with the Compass Growth Vision Principles. Table 5.D has been added to the EIR (Section 3.0 Errata in the Final EIR) indicating the proposed project's consistency with the Compass Growth Vision Principles. No further response is required.

Draft EIR, Section 5 5.4 Consistency With Local And Regional Plans, Page 5-12:

> ~~The proposed project is consistent with the four principles identified above. The nature of the proposed project allows the transport of commodities from a single area rather than multiple areas, minimizing vehicle trip generation. The proposed project supports the prosperity for all people by providing employment opportunities close to existing housing within the City of Moreno Valley. The proposed project is located in an area that is already developed with urban uses and where existing infrastructure (freeway, sewer, electrical, water, etc.) is accessible. During the construction of the project and as needed throughout the process, necessary utility and roadway improvements will be installed or extended to the project site from adjacent existing facilities. The utility and roadway improvements will facilitate future growth in the surrounding area. The development of the proposed project is consistent with the land use vision for the site and will augment existing services available in the City and region.~~

In addition, a new table (Table 5.D: Compass Growth Vision Report Consistency) has been added as follows.

Table 5.D: Compass Growth Vision Report Consistency

Policy	Consistency Analysis
Principle 1: Improve mobility for all residents. • Encourage transportation investments and land use decisions that are mutually supportive. • Locate new housing near existing jobs and new jobs near existing housing. • Promote a variety of travel choices.	The project is consistent with this principle. The actions associated with implementation of the proposed project would allow for warehousing uses to be clustered around other industrial and commercial uses and would encourage a reduction of vehicle miles traveled within the City. Implementation of the project would create approximately 646 jobs. Existing housing is located approximately 1 mile to the north and 2 miles to the south of the project site. The project is consistent with this portion of Principle 1. There are a number of transit-oriented strategies that could be implemented by the proposed project to encourage alternate modes of travel, including informational strategies, incentives, and services. (Refer to Mitigation Measure 4.2.6.3A).

Table 5.D: Compass Growth Vision Report Consistency

Policy	Consistency Analysis
Principle 2: Foster livability in all communities. • Promote developments which provide a mix of uses. • Promote "people scaled, "walkable communities. • Support the preservation of stable, single-family neighborhoods.	The project is consistent with the applicable portions of this principle. The proposed project is a warehousing project and does not include any residential uses. Therefore, the project is not considered to be a mixed use project and this portion of Principle 2 is not applicable to the project. The project site is located in an industrial warehouse area. The project would include sidewalks so that the opportunity of being walkable within this warehouse area is possible. Therefore, the project is consistent with this portion of Principle 2. The proposed project is a warehousing project and does not include any residential uses. Therefore this portion of Principle 2 is not applicable to the project.
Principle 3: Enable prosperity for all people. • Provide in each community a variety of housing types to meet the housing needs of all income levels. • Support educational opportunities that promote balanced growth. • Ensure environmental justice regardless of race, ethnicity, or income class. • Support local and state fiscal policies that encourage balanced growth. • Encourage civic engagement.	Based on the information provided below, this principle is not applicable to the project. The proposed project is a warehousing project and does not include any residential or educational uses. Therefore this portion of Principle 3 is not applicable to the project. The project site is vacant and the project located in an area identified for industrial and commercial uses. Therefore, this issue not applicable to the project. The supporting of local and state fiscal policies and the encouragement of civic engagement is at the City level not the project level. Therefore, this portion of the principle is not applicable to the project.
Principle 4: Promote sustainability for future generations. • Focus development in urban centers and existing cities. • Develop strategies to accommodate growth that uses resources efficiently, eliminate pollution and significantly reduce waste. • Utilize "green" development techniques.	The project is consistent with this principle. The proposed project is located in an area that is already developed with urban uses and where existing infrastructure (freeway, sewer, electrical, water, etc.) is accessible. Mitigation Measure 4.3.1.6B requires the project to implement various sustainability strategies and "green" development techniques that uses resources efficiently, eliminates pollution, and reduces waste.

Response to Comment D-91. See Response to Comment D-53. The import of fill (220,000 cubic yards) to the project site was considered in the evaluation of the air quality impacts attributable to the proposed project (Section 4.2 Air Quality, page 4.2-20) The 80,000 cubic yards of fill that is currently on-site is considered the baseline (existing on-site conditions) and this fill was imported to the project site as part of a previously approved stockpile permit (page 3-3) that predated the proposed project.

Response to Comment D-92. As noted in Response to Comment D-11, the commentor incorrectly asserts that the environmentally superior alternative meets most project objectives and must be approved instead of the proposed project. Although the City concedes that the environmentally superior alternative (reduced density) will result in reduced air pollution and GHG emissions, it bears

noting that impacts associated with these issues would remain significant and unavoidable for air quality, global climate change, and traffic in the same manner as the proposed project (see Table 6.K, page 6-31). The significant and unavoidable project impacts associated with greenhouse gas emissions and traffic cannot be reduced to less than significant though reduction in the size of the project. However, the significant and unavoidable project impacts associated with air quality can be eliminated if the project is reduced to approximately 90,000 square feet (based on a linear reduction in the project's 990 pounds per day of operational NO_x emissions to below the 55 pounds per day threshold).

The commentor mistakenly claims that the reduced intensity alternative (Alternative 2) would meet the following project objectives: "Provide a high density, high-quality large-scale industrial development to provide jobs for residents at a variety of income levels" and "Cluster industrial warehouse uses near efficient access points to the state highway system to reduce traffic congestion on surface streets and to reduce concomitant air pollutant emissions from vehicle sources reduces impacts to air quality, global climate change, and traffic." This is due to the fact that reduced-intensity development patterns are in concept diametrically opposite of the highly dense form of development patterns that are characteristic of clustered development. Said another way, the reduced intensity alternative would result in use of the entire project site in an inefficient manner with associated negative effects such as sprawl.

Response to Comment D-93. The commentor mistakenly claims that there is no basis for the Draft EIR statement that the reduced intensity alternative would have impacts similar to the proposed project. As shown in Table 6.K, the reduced intensity alternative (Alternative 3) would reduce impacts to air quality, global climate change, and traffic. This is due to the reduction in the air pollution emissions, greenhouse gas emissions, and trip generation attributable to the alternative linearly related to the reduction in building square footage (1,616,133 square feet versus 1,212,100 square feet). However, the significant and unavoidable impacts associated with this alternative would remain, similar to the proposed project.

Response to Comment D-94. See Response to Comment D-92.

Response to Comment D-95. See Response to Comment D-93. The significant and unavoidable air quality, global climate change, and traffic impacts associated with the reduced intensity alternative would remain, similar to the proposed project.

Response to Comment D-96. It is not clear as to what the commentor is attempting to point out. If the commentor is suggesting that an alternative be examined that couples both a reduction in development intensity and at an alternative site, the City disagrees. The purpose of the alternative site is to examine the possibility of reducing project impacts by moving it to an alternate location.

Response to Comment E-97. The commentor has attached various references. No response is required.

RE: VIP Moreno Valley project's Draft Environmental Impact Report (DEIR).

The Sierra Club appreciates this opportunity to comment on this DEIR. Much of what you will read below was in our NOP comments, but we feel they were not adequately addressed. We hope to read your responses in the FEIR which do fully answer our comments, concerns, suggestions and questions. Most of our concerns are about Global Warming, Climate Change, Greenhouse Gas Pollution and Air Pollutant emissions. These concerns can be read below and we expect this project to do everything possible to mitigate these problems in our non-attainment area. Your NOP mentions that the consumption of electricity by this warehouse "would generate air pollutant emissions." While the Sierra Club understands that you "expect to reach LEED certified rating", we do not understand why you do not match the higher Gold LEED certification recently agreed to by the Alessandro Business Center warehouse in the City of Riverside or even the LEED Silver of Skechers. In fact your words do not guarantee anything about even reaching the lowest level of LEED certification. The City needs to require you to hire a LEED expert and then require you to become LEED certified--hopefully higher than just certified. You could pay less than $1,000 and lock in current LEED standards for your building. Through the installation of solar panels and other LEED ideas you could avoid generating air pollutants with the electricity you consume. This warehouse and all warehouses need to be required to have their roofs built to accommodate the maximum number of solar panels. You are now able to sell excess energy back and earn money as well as do right for our non-attainment area. The DEIR indicates that the "proposed project would unavoidably contribute to significant long-term cumulative air quality impacts."(p 4.2-29) The Sierra Club does not believe it is totally unavoidable. The fact you are given a cafeteria list of mitigations to chose from shows that there is more that could and should be done to protect the health of area residents. Why isn't there a requirement to exceed Title 24 by at least 25% instead of just "exceed" Title 24? (p 4.3-25) Agreeing to require 90% of your off road construction equipment meet Tier III standards would also significantly help our non-attainment city and county. Your DEIR only mentions Tier II and therefor it shows you are not serious about the health of the area's residents.

1
2
3
4
5
6

Continuing to pave over Prime Agricultural lands as well as those of Local and State Importance must be mitigated. Having locally grown products also cuts down on the Climate Change problems mentioned above and below. Recently a developer donated $100,000 to the Riverside Land Conservancy to help mitigate for the loss of Ag Lands. The San Jacinto Basin Resource Conservation District is another entity which would use your monetary donation to mitigate the loss of important Ag lands as well as the loss of lands for raptor foraging. It is therefore incorrect to say that "no feasible mitigation is available." Please consider how your project will seriously mitigate you impacts to Agriculture. You should also make sure your parking provides ample reserved spaces for several form of cars using alternative fuels. Their parking lot also needs to be made of porous material to help with ground water recharge and to lessen run off. 7 8 9

The Sierra Club appreciates that you have the World Logistic Center on your Cumulative Project List. We, however, do not believe all of your analysis have included this massive project. The FEIR will be inadequate unless this and all other projects are part of the analysis in each area of the FEIR. I also did not see the Pro Logis project listed which would be located near the Moreno Valley Auto Mall. Since some of Moreno Valley's designated truck routes pass by schools and their playgrounds, the Sierra Club expects the FEIR to explain what requirements will be placed on the tenants to avoid this very toxic situation as well as the truckers who will deliver/pickup products for your warehouse. The FEIR needs to show the walking/bicycling routes students take to and from school as well as show how this project's diesel truck traffic will impact the health of these students. There are two schools which are only about one mile from the project as well as others which may have students impacted by VIP's toxic diesel trucks. The projects distance from homes needs to be easily understood as well as all the paths trucks could take to the warehouse. Requiring staging areas for diesel equipment to be only a couple of hundred feet from sensitive receptors is inadequate for the health of Moreno Valley Residents. How will you protect the warehouse workers from the long term health affects of breathing toxic diesel emissions throughout their workday and employment? What equipment will you make sure is electric instead of diesel or gasoline in order to lessen pollution and better protect the workers--this includes gardening equipment? The FEIR needs to explain how noise barriers used during construction and use of the warehouse could lessen impacts identified in the Initial Study. Impacts to our local streets as well as our very crowded freeways need to be explained so the average citizen will understand. The FEIR-not just appendices- needs to show the length of trips the diesel trucks will be taking when driving to and from the warehouse as well as their routes. We need to know the maximum number of tucks which will use this warehouse each workday and not just after the first year, but when the warehouse is being used to its maximum capacity during peak times of the year. Your traffic analysis is inadequate unless it includes all of SR 60 which border any part of Moreno Valley. This two and three lane roadway will be significantly affected by VIP traffic-especially when part of cumulative impacts. Decision makers have a right to know before they vote that the section of SR 60 passing through Moreno Valley will become a parking lot with significant pollution. Even your own analysis of some major intersection in our City show they will become LOS F by 2013. Simply paying into a pot of money which may not be used in the impacted part of Moreno Valley does not mitigate your traffic. 10 11 12 13 14 15 16 17 18 19 20

The land should not be disced or graded for at least six months prior to doing the Burrowing Owl survey otherwise many will believe you are just making it difficult on this special animal as well as making it more likely it will be listed as endangered. The Sierra Club believes the FEIR will 21 22

be inadequate unless our concerns and issues found throughout this letter are thoroughly addressed within the document. 22

I. THE DEIR MUST ADEQUATELY ADDRESS THE IMPACTS OF GLOBAL WARMING AND CLIMATE CHANGE

As a potential significant impact, the Final EIR (FEIR) must more thoroughly evaluate alternatives and mitigation measures that would reduce the Project's greenhouse gas emissions. Curbing greenhouse gas emissions to limit the effects of climate change is one of the most urgent challenges of our time. Fortunately, the California Environmental Quality Act ("CEQA"), Cal. Pub. Res. Code ¤¤ 21000 et seq., 14 Cal. Code Regs. ¤ 15000 et seq. ("Guidelines"), set forth a clear and mandatory process to address the Project's greenhouse gas and global warming impacts. This letter sets forth how this analysis should be completed. 23

A. THE DEIR MUST ADEQUATELY SET FORTH THE THREAT OF GREENHOUSE GAS POLLUTION AND GLOBAL WARMING

The FEIR must discuss the grave threats posed by global warming to California and the world. Current scientific consensus on climate change has now determined that the link between greenhouse gas emissions and global warming is highly certain. In California, elected leaders, through Executive Order S-03-05 and the California Global Warming Solutions Act of 2006 (AB 32), have also squarely linked greenhouse gases with global warming. 24

In order to conform to CEQA's informational mandates and properly inform the public and decision makers of the significance of the Project's contribution to greenhouse gases, the DEIR must first adequately discuss the threat posed by greenhouse gas emissions and avoid minimizing or discounting the severity of global warming's impacts. *See* Guidelines ¤ 15151. *See, e.g., Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.* ("Laurel Heights I"), 47 Cal.3d 376, 392 (1988) (EIR is intended "to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action."); Guidelines ¤ 15151 (requiring an FEIR be detailed, complete, and reflect a good faith effort at full disclosure). A discussion of global warming impacts need not be lengthy, but should, at a minimum, convey the magnitude of the threat posed by global warming to humans and the environment. For the City's convenience, a scientific background on global warming and the specific threats posed to California is provided below. 25 26

i. Scientific Background on Climate Change

There is no longer credible scientific dispute that the climate is warming. In its most recent assessment, the Intergovernmental Panel on Climate Change ("IPCC") concluded that "[w]arming of the climate is unequivocal, as is now evident from observations of increases in global average air and ocean temperatures, widespread melting snow and ice, and rising mean sea level." (IPCC 2007a). Expressed as a global average, surface temperatures have increased by about 0.74°C over the last hundred years, with 11 of the 12 warmest years on record having occurred in the past 12 years (IPCC 2007a). In September 2007, Arctic sea ice plummeted to a record-low level not anticipated by most climate models until 2050, leading scientists to predict 27

that the Arctic could be ice-free in summer by 2030 (National Snow & Ice Data Center 2007).[1] Other observed consequences of the warming climate include sea level rise, increased frequency of droughts, floods, and heat waves and substantial increases in the duration and intensity of hurricanes (IPCC 2007a).

The IPCC now states with "very high confidence" that most of the warming observed over the past 50 years is the result of human generation of greenhouse gases, including carbon dioxide, methane, and nitrous oxide[2] (IPCC 2007a). The rapid warming observed since the 1970s has occurred in a period when the increase in greenhouse gases has dominated over all other factors (IPCC 2007a). The largest known contribution to global warming is from carbon dioxide (IPCC 2007a). Fossil fuel combustion is responsible for more than 75% of human caused carbon dioxide emissions with the remainder due to land-use change (primarily deforestation) (IPCC 2007a). The global atmospheric concentration of carbon dioxide has increased from a pre-industrial value of about 280 parts per million (ppm) to 379 ppm in 2005, a level that has not been exceeded during the past 650,000 years (during which carbon dioxide concentrations remained between 180 and 300 ppm). (IPCC 2007a; Canadell et al. 2007). In 2006, carbon dioxide concentrations reached a new high of 381.2 ppm (World Metrological Organization 2007). As greenhouse gas concentrations increase, more heat reflected from the earth's surface is absorbed by these greenhouse gases and radiated back into the atmosphere and to the earth's surface.[3] Consequently, the higher the level of greenhouse gas concentrations, the larger the degree of warming experienced.

At current growth rates and continued reliance on fossil fuels, atmospheric concentrations of carbon dioxide would likely exceed 1,000 ppm by the end of the century, resulting in an average global temperature increase of more than 5°C (United Nations Foundation & Sigma XI 2007). This is equivalent to the change in temperature since the last ice age – an era in which Europe and North America was under more than one kilometer of ice (United Nations Foundation & Sigma XI 2007). The growing consensus among climate scientists is that the threshold for dangerous climate change, whereupon a potential "tipping point" is reached and ecological changes become dramatically more rapid and out of control, is estimated at a temperature increase of around 2°C from pre-industrial levels, or an atmospheric concentration of carbon dioxide of approximately 450 ppm (United Nations Foundation & Sigma XI 2007; IPCC 2007c). In 2006, Dr. James E. Hansen, Director of the NASA Goddard Institute for Space Studies, and NASA's top climate scientist, stated: "In my opinion there is no significant doubt (probability > 99%) that . . . additional global warming of 2° C would push the earth beyond the tipping point and cause dramatic climate impacts including eventual sea level rise of at least several meters, extermination of a substantial fraction of the animal and plant species on the planet, and major regional climate disruptions" (Hansen et al. 2006). More recently however, given the recent unpredicted and extreme rate of loss of arctic ice observed in 2007, Dr. Hansen

27

---

[1] Based on the startling loss of sea ice in 2007, some scientists have predicted that "the Artic Ocean could be nearly ice-free at the end of the summer by 2012." Seth Borenstein, *Ominous Arctic Melt Worries Experts*, Associated Press, Dec. 11, 2007.

[2] *IPCC, 2007: Summary for Policymakers, in* CLIMATE CHANGE 2007: THE PHYSICAL SCIENCE BASIS, CONTRIBUTION OF WORKING GROUP I TO THE FOURTH ASSESSMENT REPORT OF THE INTERGOVERNMENTAL PANEL ON CLIMATE CHANGE at 4 (Susan Solomon et al. eds., Cambridge Univ. Press 2007) at 2-3. "Very high confidence" is defined at "at least a 9 out of 10 chance of being correct." *Id.* at 3 n.7.

[3] Greenhouse gases have a warming effect because, when solar radiation is reflected by the earth, greenhouse gases capture this thermal radiation and reradiate it back to earth, much like the effect of a common garden greenhouse resulting in the "greenhouse effect."

concluded that "the safe upper limit for atmospheric CO_2 is no more than 350 ppm" (McKibben 2007). Moreover, according to Hansen, just 10 more years of "business-as-usual" global emissions will make it difficult, if not impossible, to keep atmospheric concentrations of greenhouse gases at levels necessary to avoid a temperature increase above 2°C (Hansen et al. 2007).

Keeping the climate within the 2°C threshold requires significant reductions in the world's greenhouse gas emissions. To reach this objective, it is estimated that developed countries would have to target an emissions peak between 2012 and 2015, with 30 percent cuts by 2020 and 80 percent cuts from 1990 levels by 2050 (United Nations Foundation & Sigma XI 2007). In recognition of need for immediate action, California has committed itself though Executive Order S-3-05 and the California Global to reduce the state's emissions to 1990 levels by 2020 and by 80% reductions from 1990 levels by 2050. Ca. Health & Safety Code ¤ 38550; Cal. Executive Order S-3-05 (2005).

The costs of taking no action to reduce greenhouse gas emissions far outweigh the costs of stabilizing emissions. The Stern Review of the Economics of Climate Change, a comprehensive report commissioned by the British government, recently concluded that allowing current emissions trajectories to continue unabated would eventually cost the global economy between 5 to 20 percent of GDP each year within a decade, or up to $7 trillion, and warned that these figures should be considered conservative estimates (Stern 2006). By contrast, measures to mitigate global warming by reducing emissions were estimated to cost about one percent of global GDP each year, and could save the world up to $2.5 trillion per year (Stern 2006). The Stern Report determined that if no action is taken to control greenhouse gas emissions, each ton of CO_2 emitted causes damage worth at least $85 (Stern 2006). 27

ii. Impacts to California from Global Warming

Climate change poses enormous risks to California. Scientific literature on the impact of greenhouse gas emissions on California is well developed.[4] The California Climate Change Center ("CCCC") has evaluated the present and future impacts of climate change to California and the project area in research sponsored by the California Energy Commission and the California Environmental Protection Agency (Cayan et al. 2007). The severity of the impacts facing California is directly tied to atmospheric concentrations of greenhouse gases (Cayan et al. 2007; Hayhoe et al. 2004). According to the CCCC aggressive action to cut greenhouse gas emissions today can limit impacts, such as loss of the Sierra snow pack to 30%, while a businessas-usual approach could result in as much as a 90% loss of the snowpack by the end of the century. As aptly noted in a report commissioned by the California EPA:

Because most global warming emissions remain in the atmosphere for decades or centuries, the choices we make today will greatly influence the climate our children and grandchildren inherit. The quality of life they experience will depend on if and how rapidly California and the rest of the world reduce greenhouse gas emissions (Cayan et al. 2007).

Some of the types of impacts to California and estimated ranges of severity – in large part dependent on the extent to which emissions are reduced – are summarized as follows:

• A 30 to 90 percent reduction of the Sierra snowpack during the next 100 years, including earlier melting and runoff.

• An increase in water temperatures at least commensurate with the increase in air

[4] Additional reports issued by California agencies are available at http://www.climatechange.ca.gov, and IPCC

temperatures.
• A 6 to 30 inch rise in sea level, before increased melt rates from the dynamical properties of ice-sheet melting are taken into account.
• An increase in the intensity of storms, the amount of precipitation and the proportion of precipitation as rain versus snow.
• Profound impacts to ecosystem and species, including changes in the timing of life events, shifts in range, and community abundance shifts. Depending on the timing and interaction of these impacts, they can be catastrophic.
• A 200 to 400 percent increase in the number of heat wave days in major urban centers.
• An increase in the number of days meteorologically conducive to ozone (O_3) formation.
• A 55 percent increase in the expected risk of wildfires (Cayan et al. 2007).
By providing details as to the ranges of proposed impacts, and indicating that the higher-range of impact estimates are projected if greenhouse gas emissions continue to increase under a "business as usual" scenario, decision-makers and the public will be better informed of the magnitude of the climate crisis and the urgency with which it must be addressed. 27

Finally, the DEIR should also include a brief discussion of other laws to address climate change, including California's mandate to reduce emissions to 1990 levels by 2020 and goal of further reducing emissions to 80% below 1990 levels by 2050. Achievement of state mandated emissions reductions will be severely impeded if agencies across the state continue to approve *new* projects without incorporating measures to reduce the added emissions created by these. 28

B. The EIR the Project Must Include an Inventory and Analysis of the Project's Projected Greenhouse Gas Emissions

The first step in determining a project's greenhouse gas pollution impact is to complete a full inventory of all emissions sources. In conducting such an inventory, all phases of the proposed project must be considered. *See* 14 Cal. Code Regs. ¤ 15126. A basic requirement of CEQA is that "[a]n EIR should be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences." 14 Cal. Code Regs. ¤ 15151. The greenhouse gas inventory for a project must include a complete analysis of all of a project's substantial sources of greenhouse gas emissions, from building materials and construction emissions to operational energy use, vehicle trips, water supply and waste disposal. 29 30 31

A greenhouse gas inventory for the project must include the project's direct and indirect greenhouse gas emissions. *See* 14 Cal. Code Regs ¤ 15358(a)(1) (Indirect or secondary effects may include effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems.). Consequently, a complete inventory of a project's emissions should include, at minimum, an estimate of emissions from the following: 32

• Fugitive emissions of greenhouses gases, such as methane, from the proposed project;
• Emissions during construction from vehicles and machinery;
• Manufacturing and transport of building materials;
• Electricity generation and transmission for the heating, cooling, lighting, and other energy demands of the project;
• Water supply and transportation to the project; 33

• Vehicle trips and transportation emissions generated by the project;
• Wastewater and solid waste storage or disposal, including transport where applicable; and
• Outsourced activities and contracting. 33

Methodologies are readily available to inventory the emissions from the proposed project. In its recent white paper, CEQA & Climate Change, Evaluating and Addressing Greenhouse Gas Emissions from Projects Subject to the California Environmental Quality Act (Jan. 2008), the California Air Pollution Control Officers Association (CAPCOA) set forth methodologies for analyzing greenhouse gas pollution (CAPCOA 2008) The California Office of Planning and Research ("OPR") has also released technical guidance on the preferred approach for analyzing greenhouse gas emissions and climate change entitled "Technical Advisory, CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review" (California OPR 2008). OPR also provides references to methodologies to quantify greenhouse gas emissions. In addition to the methodologies set forth by CAPCOA and OPR, ICLEI's Clean Air/Climate Protection (CACP) software allows cities to calculate emissions reductions, track and quantify emission outputs, and develop emissions scenarios to inform the planning process.[5] As noted in the ICLEI Climate Action Handbook, "Expertise in climate science is not necessary" to conduct an emissions inventory and compare this inventory against a forecast year (ICLEI). "A wide range of government staff members, from public works to environment and facilities departments, can conduct an inventory" (ICLEI). ICLEI also provides technical assistance and training to local government using the CACP software. It is incumbent on the City to "disclose all it can" about project impacts and educate itself on methodologies that are available to measure project emissions. *Berkeley Keep Jets Over the Bay Comm. v. Board of Port Comm'rs ("Berkeley Jets")*, 91 Cal. App. 4th 1344, 1370 (2001). 34

As with any other project under CEQA, the baseline used for analyzing the impacts of a project is the existing on the ground environmental conditions at the time of the NOP. *See Environmental Planning & Information Council v. County of El Dorado (EPIC)*, 131 Cal.App.3d 350, 355 (1982) (effect of general plan amendment must be compared against actual environment, not assumptions in existing general plan). Accordingly, the DEIR should compare emissions from existing conditions with those that would result from the development of the project, as well as those that would occur under any proposed alternative scenarios. Because the Project envisions development over a long period, the EIR should also provide data on the trajectory for emissions in the planned community and under each proposed alternative in five-year increments. 35 36

Without a complete inventory, the DEIR cannot adequately inform the public and decision-makers about the Project's impacts. Similarly, without a complete inventory and analysis of greenhouse gas emissions that will result from the project, there is simply no way that The EIR can then adequately discuss alternatives, avoidance, and mitigation measures to reduce those impacts. 37

C. THE EIR MUST ADDRESS THE IMPACT GLOBAL WARMING WILL HAVE

---

[5] ICELI's Clean Air/Climate Protection software is available at http://www.cacpsoftware.org/ ICLEI-Local Governments for Sustainability is an international association of more than 650 local governments. Cities, counties, towns and villages around the world are members of ICLEI. ICLEI's mission is to improve the global environment through local action. On the issue of global warming, for example, ICLEI provides resources, tools, peer networking, best practices, and technical assistance to help local governments measure and reduce greenhouse gas emissions in their communities.

ON THE PROJECT

California's temperatures are expected to rise "dramatically" over the course of this century (Cayan 2007). These factors will impact the planned project, as well as exacerbate its own environmental impacts.

The rise in temperatures resulting from global warming will create a more conducive environment for air pollution formation (Cayan 2007). This will intensify the adverse effects the proposed project will already have on air quality in the project area and threaten residents' health (Cayan 2007).

Significantly for the state, as well as the project area, is global warming's impact on water supply. The IPCC specifically identified the American West as vulnerable, warning, "Projected warming in the western mountains by the mid-21st century is very likely to cause large decreases in snowpack, earlier snow melt, more winter rain events, increased peak winter flows and flooding, and reduced summer flows" (IPCC 2007b). Recently, researches found that an increase in atmospheric greenhouse gases has contributed to a "coming crisis in water supply for the western United States" (Barnett 2008). Using several climate models and comparing the results, the researches found that "warmer temperatures accompany" decreases in snow pack and precipitation and the timing of runoff, impacting river flow and water levels (Barnett 2008). These researchers concluded with high confidence that up to 60 percent of the "climate related trends of river flow, winter air temperature and snow pack between 1950-1999" are human-induced.

(Barnett 2008). This, the researchers wrote, is "not good news for those living in the western United States" (Barnett 2008). 38

The California Center on Climate Change has also recognized the problem global warming presents to the state's water supply and predicts that if greenhouse gas emissions continue under the business-as-usual scenario, this snowpack could decline up to 70-90 percent, affecting winter recreation, water supply and natural ecosystems (Cayan 2007). Global warming will affect snowpack and precipitation levels, and California will face significant impacts, as its ecosystems depend upon relatively constant precipitation levels and water resources are already under strain (Cayan 2007). The decrease in snowpack in the Sierra Nevada will lead to a decrease in California's already "over-stretched" water supplies (Cayan 2007). It could also potentially reduce hydropower and lead to the loss of winter recreation (Cayan 2007). All of this means "major changes" in water management and allocation will have to be made (Cayan 2007). Thus, global warming may directly affect the City's ability to supply clean, affordable water to the residents, or force the City to change how it will utilize water, and it may also impact other activities outside the project area, such as agriculture.

Scientists indicate that climate change will also exacerbate the problem of flooding by increasing the frequency and magnitude of large storms, which in turn will cause an increase in the size and frequency of flood events (NRDC 2007). The increasing cost of flood damages and potential loss of life will put more pressure on water managers to provide greater flood protection (NRDC 2007). At the same time, changing climate conditions (decreased snowpack, earlier runoff, larger peak events, etc.) will make predicting and maximizing water supply more difficult (NRDC 2007). These changes in hazard risk and water supply availability must be considered during environmental review. 39

Water quality, in addition to water quantity and timing, will also be impacted. Changes in precipitation, flow, and temperature associated with climate change will likely exacerbate water quality problems (NRDC 2007). Changes in precipitation affect water quantity, flow rates, and flow timing (Gleick 2000). Shifting weather patterns are also jeopardizing water quality and 40

quantity in many countries, where groundwater systems are overdrawn (Epstein 2005). Decreased flows can exacerbate the effect of temperature increases, raise the concentration of pollutants, increase residence time of pollutants, and heighten salinity levels in arid regions (Schindler 1997). 40

These are only examples of how global warming will impact the proposed project and intensify the environmental impacts the project will already have. It is not an exhaustive list. Thus, when assessing the impact of the Project on air quality, water supply, flood hazards, and biological resources, the EIR must take into account global warming. To ignore the impact of global warming on the Project and the resources impacted by the Project would significantly understate Project impacts. 41

D. THE PROJECT'S GREENHOUSE GAS IMPACTS ARE CLEARLY SIGNIFICANT

The greenhouse gas emissions generated by a project of this size and scope will have a clearly significant cumulative impact. An impact is considered significant where its "effects are individually limited but cumulatively considerable." Guidelines ¤ 15065(a)(3). Climate change is the classic example of a cumulative effects problem; emissions from numerous sources combine to create the most pressing environmental and societal problem of out time. *Ctr. for Biological Diversity*, 508 F.3d 508, 550 (9th Cir. 2007) ("the impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis that NEPA requires agencies to conduct."); *Kings County Farm Bureau v. City of Hanford*, 221 Cal. App. 3d 692, 720 (1990) ("Perhaps the best example [of a cumulative impact] is air pollution, where thousands of relatively small sources of pollution cause a serious environmental health problem."). While a particular project's greenhouse gas emissions represent a fraction of California's total emissions, courts have flatly rejected the notion that the incremental impact of a project is not cumulatively considerable because it is so small that it would make only a de minimis contribution to the problem as a whole. *Communities for a Better Environment v. California Resources Agency*. 103 Cal.App.4th 98, 117 (2002); see also *Kings County Farm Bureau,* 221 Cal. App. 3d at 720 ("[p]erhaps the best example of [a cumulative impact] is air pollution, where thousands of relatively small sources of pollution cause a serious environmental health problem."). 42

In addition. there is nothing speculative about the fact that higher levels of greenhouse gas pollution will lead to greater impacts, which is why the State of California has prioritized greenhouse gas pollution reductions under AB 32. Moreover, in the analogous context of the National Environmental Policy Act (NEPA), the Ninth Circuit has already rejected the argument that "global warming is too speculative to warrant NEPA analysis." *Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, 508 F.3d at 554. 43

In addition, lack of established significance thresholds does not excuse an agency from its obligation under CEQA to determine the significance of a Project's impacts. CEQA routinely calls for an agency to evaluate impacts in the absence of thresholds or to exercise its individual discretion in determining the significance of an impact. *See, e.g., Protect the Historic Amador Waterways*, 116 Cal. App. 4th at 1111 (agency required to assess potential impact not listed in CEQA checklist). The development of significance thresholds is "encouraged" and not a prerequisite for an impact analysis. Guidelines ¤ 15064.7. Indeed, as noted in the CAPCOA white paper on CEQA and Climate Change, "[t]he absence of a threshold does not in any way relieve agencies of their obligations to address GHG emissions from projects under CEQA" (CAPCOA 2008). In fact, CEQA may require additional analysis even if a project meets an adopted standard, if other evidence indicates the project may nonetheless have a significant 44

impact. *See Berkeley Keep Jets Over the Bay Committee v. Board of Port Commissioners*, 91 Cal.App.4th 1344, 1380-82 (2001). 44

As the lead agency, CEQA requires the City to determine the significance of the Project's emissions with or without established significance thresholds. Guidelines ¤ 15064. CAPCOA provides various means by which a lead agency can determine the significance of project emissions (CAPCOA 2008). Importantly, a universally adopted methodology is *not* necessary to analyze project impacts. *Berkeley Keep Jets*, 91 Cal.App.4th at 1370 ("the fact that a single methodology does not exist…requires the [respondent] to do the necessary work to educate itself about the different methodologies that *are* available.").

"The determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data." Guidelines ¤ 15064(b). Any determination of whether there is a fair argument that the project may have a significant impact must include the consideration of the California Global Warming Solutions Act of 2006 (AB 32), wherein the State of California recognized that "global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California" and required that existing levels of greenhouse gases be reduced to 1990 levels by 2020. Health & Safety Code ¤¤ 38501(a), 38550. Because AB 32 establishes that existing greenhouse gas levels are unacceptable and must be substantially reduced within a fixed timeframe, any additional emissions that contribute to existing levels frustrate California's ability to meet its ambitious and critical emissions reduction mandate. Ignoring emissions from smaller sources would be neglecting a major portion of the greenhouse gas inventory. 45

In accordance with the scientific and factual data, the City should adopt a zero significance threshold for the Project's greenhouse gas emissions. As noted by the Ninth Circuit in *Center for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*:

[W]e cannot afford to ignore even modest contributions to global warming. If global warming is the result of the cumulative contributions of myriad sources, any one modest in itself, is there not a danger of losing the forest by closing our eyes to the felling of the individual trees? 46

508 F.3d 508, 550 (9th Cir. 2007). Accordingly, the City must unequivocally consider Project emissions to be a potentially significant impact.

E. THE EIR MUST ANALYZE AND ADOPT ALL FEASIBLE MITIGATION MEASURES TO REDUCE THE PROJECT'S GREENHOUSE GAS EMISSIONS

In addition to thoroughly evaluating project alternatives, because it is clear that the project's greenhouse gas emissions will cumulatively contribute to global warming, "the EIR must propose and describe mitigation measures that will minimize the significant environmental effects that the EIR has identified." *Napa Citizens for Honest Gov't v. Napa County Bd. of Supervisors*, 91 Cal.App.4th 342, 360 (2001). CEQA requires that agencies "mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so." Pub. Res. Code ¤ 21002.1(b). Mitigation of a project's significant impacts is one of the "most important" functions of CEQA. *Sierra Club v. Gilroy City Council*, 222 Cal.App.3d 30, 41 (1990). Therefore, it is the "policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures which will avoid or substantially lessen the significant environmental effects of such projects." Pub. Res. Code ¤ 21002. Importantly, mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will 47

actually be implemented as a condition of development." *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles*, 83 Cal.App.4th 1252, 1261 (2000).
To the extent that the project moves forward as planned, there are many mitigation measures the City can consider, as described below. This is not an exhaustive list and the EIR should explore these and all other feasible mitigation measures that will reduce the project's greenhouse gas emissions (CAPCOA 2008; California Office of the Attorney General 2008). 47

i. Land Use Measures Reducing Traffic Flow

The development plan for the proposed project should incorporate public transit into the project design and should attempt to facilitate the use of public transit. (California Office of the Attorney General 2008). Additionally, the FEIR should analyze ways of including pedestrian and bicycle only streets and plazas within the development and create routes that will allow residents to reach the commercial center, schools and parks by public transportation, bicycling and walking. 48

ii. Land Use and Energy

The FEIR should consider mitigation measures that will ensure the planned community will use energy efficiently and conservatively. In doing so, it should analyze incorporating "green building" in the development. Green buildings are those buildings that lower energy consumption, use renewable energy, conserve water, harness natural light and ventilation, use environmentally friendly materials and minimize waste (Commission for Environmental Cooperation 2008). 49

Buildings create environmental impacts throughout their lifecycle, from the construction phase to their actual use to their eventual destruction (Commission for Environmental Cooperation 2008). In the United States, buildings account for 40 percent of total energy use, 68 percent of total electricity consumption, and 60 percent of total non-industrial waste (Commission for Environmental Cooperation 2008). Buildings also significantly contribute to the release of greenhouse gases. In the U.S. they account for 38 percent of total carbon dioxide emissions (Commission for Environmental Cooperation 2008). More specifically, residential buildings cause up to 1,210 megatons of carbon dioxide, while commercial building create approximately 1,020 megatons (Commission for Environmental Cooperation 2008). This is because buildings require a lot of energy for their day to day operations. Most of the coal-fired power plants – one of the biggest sources of greenhouse gas emissions – slated for development in the United States will supply buildings with the energy they need. In fact, 76 percent of the energy these plants produce will go to operating buildings in the U.S. (Commission for Environmental Cooperation 2008). 50

Using green building techniques, however, can substantially reduce buildings' influence in increasing greenhouse gas emissions. Green buildings help reduce the amount of energy used to light, heat, cool and operate buildings and substitute carbon-based energy sources with alternatives that do not result in greenhouse gas emissions (Commission for Environmental Cooperation 2008). Currently green buildings can reduce energy by 30 percent or more and carbon emissions by 35 percent. (Commission for Environmental Cooperation 2008). The technologies available for green building are already in wide-use and include "passive solar design, high-efficiency lighting and appliances, highly efficient ventilation and cooling systems, solar water heaters, insulation materials and techniques, high-reflectivity building materials and 51

multiple glazing (IPCC 2007c). Additionally, the U.S. Green Building Council (USGBC), a private, nonprofit corporation, has established a nationwide green building rating system, called Leadership in Energy and Environmental Design ("LEED"). The LEED standard supports and certifies successful green building design, construction and operations. It is one of the most widely used and recognized systems, and to obtain LEED certification from the USGBC, project architects must verify in writing that design elements meet established LEED goals.
Specific mitigation for the greenhouse gas emissions generated by the Project's energy consumption include, but are not limited to:
• Analyzing and incorporating the U.S. Green Building Council's LEED (Leadership in Energy and Environmental Design) or comparable standards for energy efficient building during pre-design, design, construction, operations and management.
• Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.;
• Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.
• Reducing the use of pavement and impermeable surfaces;
• Requiring water re-use systems;
• Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting
• Limiting the hours of operation of outdoor lighting
• Maximizing water conservation measures in buildings and landscaping, using droughttolerant plants in lieu of turf, planting shade trees;
• Ensure that the Project is fully served by full recycling and composting services;
• Ensure that the Project's wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.
• Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible;
• Installing solar water heating systems to generate all of the Project's hot water requirements;
• Installing solar or wind powered electric vehicle and plug-in hybrid vehicle charging stations to reduce emissions from vehicle trips.

51

iii. Mitigation Related to Project Construction
• Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials;
• Minimize, reuse, and recycle construction-related waste;
• Minimize grading, earth-moving, and other energy-intensive construction practices;
• Landscape to preserve natural vegetation and maintain watershed integrity;
• Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.

52

iv. Transportation Mitigation Measures
• Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles;
• Create a car sharing program within the planned community;
• Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system;

53

• Provide necessary facilities and infrastructure to encourage residents to use low or zero-emission
vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations;
Provide a shuttle service to public transit within and beyond the planned community; • Incorporate bicycle lanes and routes into the planned community's street systems. 53

v. Carbon Offsets

After all measures have been implemented to reduce emissions in the first instance, remaining emissions that cannot be eliminated may be mitigated through offsets. Care should be taken to ensure that offsets purchased are real (additional), permanent, and verified, and all aspects of the offsets must be discussed in the FEIR. As demonstrated by the Office of the Attorney General offsets are a feasible CEQA mitigation measures[6] once all feasible mitigation measures have been adopted to reduce the Project's carbon footprint and produce energy using renewable sources. 54

II. THE EIR MUST CONSIDER A REASONABLE RANGE OF ALTERNATIVES

The EIR must consider a meaningful analysis of reasonable alternatives to the Project in order to lessen or avoid the Project's significant impacts. CEQA mandates that significant environmental damage be avoided or substantially lessened where feasible. Pub. Res. Code ¤ 21002; Guidelines ¤¤ 15002(a)(3), 15021(a)(2), 15126(d). A rigorous analysis of reasonable alternatives to the project must be provided to comply with this strict mandate. "Without meaningful analysis of alternatives in the EIR, neither courts nor the public can fulfill their proper roles in the CEQA process." *Laurel Heights Improvement Ass'n v. Regents of University of California*, 47 Cal.3d 376, 404 (1988). Moreover, "[a] potential alternative should not be excluded from consideration merely because it 'would impede to some degree the attainment of the project objectives, or would be more costly" even when that alternative includes Project development on an alternative site. *Save Round Valley Alliance v. County of Inyo* , 157 Cal. App. 4th 1437, 1456-57 (2007) (quotations omitted). In analyzing the no-project alternative, the EIR must discuss the need for this project andwhether the uses that would potentially utilize the Project can be accommodated in existing areas. As CAPCOA states in its white paper, one way local governments can avoid significant increases in greenhouse gas emissions and help solve the problem of global warming is to "facilitate more efficient and economic use of the lands" already developed within the community (CAPCOA 2008). Reinvesting in existing communities is "appreciably" more efficient than new development and may even result in a net reduction of greenhouse gases (CAPCOA 2008). The EIR should consider an alternative that relies more on higher-density mixed commercial/residential development projects on existing disturbed lands in order to support the reduction of vehicle trips, promote alternatives to individual vehicle travel, and encourage efficient delivery of services and goods (Office of the California Attorney General 2008). 55 56

An analysis of alternatives should also quantify the estimated greenhouse gas emissions, quantified impacts to biological resources, water resources including water quality and water 57

[6] The California Attorney General's Office has adopted CEQA settlements calling for the auditing, reduction, and offsetting of greenhouse gas emissions related with a Project demonstrating that offsets are a feasible way to reduce a Project's negative environmental effects on global warming. See http://ag.ca.gov/newsalerts/release.php?id=1466&category=global%20warming See generally http://ag.ca.gov/globalwarming/ceqa.php

availability, and traffic resulting from each proposed alternative. Where is the alternative which mentions agricultural uses in total or part? The quality of this land is such that even I could become a successful farmer. The less dense alternative two is by far superior than this project if one is serious about lessening one's impact on the environment. 57 58 59

CONCLUSION

Thank you for your attention to these comments. We look forward to working with the City to assure that the FEIR conforms to the requirements of CEQA to assure that all significant impacts to the environment are fully analyzed, mitigated or avoided. I hope the FEIR will fully address the concerns found within this letter as I did not see that within the DEIR. The Sierra Club wishes to be placed on the mailing list for all future notices and documents regarding this project. Please mail all notices to Sierra Club, San Gorgonio Chapter, Moreno Valley Group, 26711 Ironwood Ave, Moreno Valley, CA. 92555. 60 61

Thank you,

George Hague

2.12 RESPONSE TO LETTER E

Sierra Club

Response to Comment E-1. This comment suggests that the Draft EIR did not adequately address the concerns raised in their NOP response letter. The comment also requests that their concerns be addressed in the Final EIR, which they advise focuses on global warming, climate change, greenhouse gas pollution, and air pollutant emissions. Lastly, the commentor requests that the project do everything possible to mitigate these issues due to the non-attainment status of the air basin. The commentor notes that their specific issues follow in their letter.

Short-term and long-term project specific and cumulative effects of the proposed project on air quality are evaluated in Section 4.2 Air Quality pages 4.2-1 through 4.2-29 in the Draft EIR. Greenhouse gas emissions and climate change were evaluated in Section 4.3 Climate Change and Greenhouse Gas Emissions pages 4.3-1 through 4.3-27 in the Draft EIR. Where the proposed project's impacts were determined to be significant mitigation was provided to lessen those impacts. It was determined that even with the implementation of feasible mitigation measures the proposed project will have a significant and unavoidable impact on short-term construction air quality, long-term operational air quality impacts, cumulative air quality, and cumulative greenhouse gas emissions.

The concerns raised by the commentor have been responded to in Response to Comments E-1 though E-62. Any comments that were raised by the Commentor that required additions or revisions to the language in the Draft EIR are provided in Section 3.0 Errata to the Draft EIR in the Final EIR.

Response to Comment E-2. This comment states that the NOP mentions consumption of electricity by the warehouse would generate air pollutant emissions. The air quality emissions of the proposed project are analyzed in Section 4.2 Air Quality and also energy use (electricity) is analyzed in Section 4.3 Global Climate Change and Greenhouse Gas Emissions in the Draft EIR.

Response to Comment E-3. Please see Response to Comment D-8. The commentor inaccurately suggests that the project should be required to obtain a LEED Gold rating as a form of mitigation of significant impacts associated with air pollution and greenhouse gas emissions. The process of obtaining a LEED rating is not mitigation. The specific green building features that are part of the LEED rating equation can reduce air pollution and greenhouse gas emissions impacts by minimizing and reducing the quantity of emissions associated with operations of a building.

However, additional air quality related mitigation measures have been added in the Final EIR (refer to Section 3.0 Errata). Please refer to the Table contained in Response to Comment D-45 regarding operational mitigation measures that have been added. The added measures are also in the Mitigation Monitoring and Reporting Plan in Section 4.0 in the Final EIR to ensure they are implemented

Response to Comment E-4. This comment suggests that the roof of the warehouse be built to accommodate solar panels. This measure is included as part of Mitigation Measure 4.2.6.3A has been changed as follows to ensure that solar or other renewable energy source. The mitigation measure has been added in the Final EIR (refer to Section 3.0 Errata. The added measures are also in the Mitigation Monitoring and Reporting Plan in Section 4.0 in the Final EIR to ensure they are implemented

Draft EIR Section 4.2.6.3 Long Term Operation Omissions, Page 4.2-27

MV00170247

4.2.6.3A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and review and approved by the City~~.~~ The following ~~Any~~ combination of design features, ~~including but not limited to the following list, may~~ shall be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:

- ~~All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.~~

- The project shall install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs.

Response to Comment E-5. This commentor opines that they disagree with the significant and unavoidable impact associated with long-term (operational) air quality impacts. This impact is related to SCAQMD's thresholds of significance. Mitigation Measures 4.2.6.1A through 4.2.6.1M and 4.2.6.3A and 4.2.6.3B set forth a comprehensive list of measures designed to reduce the quantity of air pollution emissions from project construction as well as project operations. These construction and operational mitigation measures have been supplemented in this Final EIR with the feasible mitigation measures suggested by this commentor and comments received from Johnson & Sedlack (Letter D). It bears noting that there is no readily available way to calculate the air pollution emission reductions associated with these mitigations measures and therefore show that long-term emissions cannot be reduced to below the threshold based on this technical limitation even with implementation of unlimited mitigation.

Response to Comment E-6. Mitigation Measure 4.2.6.3.A in the Draft EIR prescribes a performance standard requiring a 20% improvement in energy efficiency (over and above the 2008 CBC) for the building and lists suggested measures that can be included in the building's design to obtain this improvement in energy efficiency. The 20% energy efficiency improvement over and above 2008 CBC building requirements has been established by air quality and climate change technicians as the project-specific energy efficiency improvement (and associated reduction in GHGs) necessary to meet the Statewide mandate of obtaining a 30% reduction in GHG emissions in comparison to 1990 levels by year 2020. In 2006, the California Legislature passed and Governor Schwarzenegger signed AB 32, the Global Warming Solutions Act of 2006, which set a 2020 greenhouse gas emissions reduction goal into law. AB 32 requires California to reduce GHG emissions to 1990 levels (estimated at 426.6 million metric tons) by 2020 (forecast to be 600 million metric tons under "business as usual"), requiring a 30% reduction in emissions in comparison to the "business as usual" scenario. Since that time, the energy efficiency requirements contained in the 2008 and 2010 updates to the CBC now require that new buildings obtain energy efficiencies that exceed the "business as usual" scenario. For this reason, the City has determined that the appropriate performance standard to meet the statewide GHG emissions reduction goals is a 20% improvement over the 2008 CBC.

Response to Comment E-7. This comment is noted. As identified in the Draft EIR (Section 4.1 Agriculture and Forestry Resources, page 4.1-5), "*Approximately 16.89 acres (23%) of the project site is designated as Prime Farmland, 16.23 acres (23%), is designated Farmland of Statewide Importance, and 38.69 acres (54%) is designed Farmland of Local Importance*." The Draft EIR accurately identifies that the project would result in the significant and unavoidable conversion of farmland to a non-agricultural use (Section 4.1 Agriculture and Forestry Resources, page 4.1-15). The project site was historically used for agricultural operations but currently lies fallow and has been fallow for a number of years. The site was most recently used as a sod farm that ceased operating in

August 2005 and has not been in agricultural production since that time. Thus no existing agricultural operation exists onsite. The project site has not been utilized to grow agricultural products in the last seven years and it is therefore not reasonable to assume that this land is available for cultivation of crops that can be grown locally to reduce potential climate change problems as cited in Comment Letter E.

This commentor also states that a developer recently donated $100,000.00 to the Riverside Land Conservancy to help mitigate for the loss of agricultural lands but fails to appropriately cite the information and identify the basis for determining the amount of agricultural lands lost in relation to this monetary amount. The City disagrees with the commentor and relys on the Fourth District Court of Appeal, *Cherry Valley Pass Acres and Neighbors v. City of Beaumont* (2010) 190 Cal.App.4th 316 (*Cherry Valley*) decision that concerned a challenge to an EIR for a project that would convert agricultural land to residential uses. Though recognizing the potential for mitigation in the form of agricultural "*conservation easements, Williamson Act preserve status, or temporary protection or conservation plans*," the EIR noted the long-term trend in agricultural land conversion in the region and concluded that mitigation was not feasible. The court upheld the City's determination regarding the feasibility of mitigation on the grounds it was supported by substantial evidence in the record. The court also examined the City and County General Plans, which acknowledged that development pressures were constraining the continued viability of agriculture and included the expansion of housing, commercial and industrial land uses. The court then determined that the project was compatible with these planning documents. The court concluded the particular circumstances surrounding the project such mitigation was infeasible and therefore was not required to be adopted. As with this project the site has been planned for industrial uses since 1987, the City has recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth and the current General Plan does not include any agricultural designations; therefore mitigation for the loss of is not required.

The trend of the reduction in agriculture in the Inland Empire is discussed in *Assessing the Economic and Market Trends Affecting Agriculture in the Western Inland Empire* prepared by Justin L. Adams, Ph.D. of Chang & Adams Consulting, September 2011 and *Economic Viability of Agriculture in the East Inland Empire* report prepared by CBRE Consulting, March 18, 2009. Both reports are provided in Appendices B and C to the Final EIR. This reduction in "farming" is due to pressures of the growth in the demand for housing and development and the transportation and warehousing sector; increased restrictions on water deliveries for agricultural uses after several consecutive drought seasons; higher wages in other industries in the region; strong agricultural competition from the southern Central Valley for dairies; increased regulatory pressures from air quality and local jurisdictions regarding particulate matter emissions and land use adjacency issues; and the trend in Riverside and San Bernardino Counties is for agricultural operations to continue to shift to places like Kern County regardless independent of land use policy due to the economic issues.

As stated on Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-12 of the Draft EIR, "*the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the '…orderly conversion of agricultural lands.' The proposed project is a continued extension of development in the surrounding area (industrial/business park). The proposed project does not interfere with the ability of other adjacent properties to be used for agricultural production should the property owner wish to do so, nor does it create any gaps of vacant or agricultural land between the proposed project and the existing adjacent development*." As described in the Draft EIR, the City's General Plan and General Plan EIR have considered and evaluated the eventual and expected conversion of agricultural activity within the City

(Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-12) Therefore, the City has already anticipated the eventual conversion of all agricultural activity within the City.

As stated in the Draft EIR, mitigation measures must be feasible and fully enforceable through permit conditions, agreements, or other legally binding considerations. To be feasible, mitigation must be capable of being accomplished in a successful manner within a reasonable period of time, taking into account the economic, environmental, legal, social, and technological factors. Identification as to the infeasibility of mitigation measures suggested by the commentor has been provided in the Draft EIR. No mechanism for the mitigation of impacts to State-designated Farmland and/or existing agricultural operations has been enacted by either the City of Moreno Valley or the County of Riverside. Rather, the City has specifically recognized that the conversion of agricultural land under its jurisdiction is an eventual and expected outcome of current and future growth. The current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the "…orderly conversion of agricultural lands." The proposed project is a continued extension of development in the surrounding area (industrial/business park). The proposed project does not interfere with the ability of other adjacent properties to be used for agricultural production should the property owner wish to do so, nor does it create any gaps of vacant or agricultural land between the proposed project and the existing adjacent development.

The potential mitigation measures identified by the City in its General Plan EIR and California Department of Conservation (CDC), which are listed in the Draft EIR (Section 4.1.6.1 Conversion of State Designated Farmland, page 4.1-11), are not considered to be feasible by the City of Moreno Valley as determined in the City's General Plan EIR. Providing protection for ongoing agricultural activities from new developments, such as requiring buffers between agricultural operation and new development or requiring the notification and disclosure of agricultural activities to the purchasers adjacent properties will not permanently protect agricultural land. As identified in the Draft EIR, the City supports agriculture as an interim use within the City and no land is dedicated or designated for agricultural use or agricultural preservation within the City's jurisdiction. With no such dedication or designation in place at this time, the establishment of urban limits, greenbelts, and buffers would not result in permanent protection of agricultural land as none exists within the City. Areas where agriculture land use designations may exist that are outside of the City limits cannot be preserved as it is outside of the City's jurisdiction.

The purchase or transfer of development rights, purchase of conservation easements, or donation of funds to assist in the conservation of agricultural land would need to be implemented to ensure the preservation of agricultural land. The City does not have a funding source for the acquisition of farmland. As stated previously, the City anticipates the conversion of agricultural land within the City and does not set aside land for permanent preservation. The City expects that the majority of the land within the City will be converted to urban uses, although some agriculture will continue as interim uses, as allowed by the City's Development Code for all zoning categories. The City of Moreno Valley has determined that these measures are economically infeasible based on the higher costs associated with land, water and labor, increased environmental regulation, and competition from neighboring regions where agricultural operations are less costly; thus, resulting in an inability to make farming profitable. Furthermore, these measures are contrary to the City's vision (as stated in its General Plan) for the project site; therefore, they are not feasible and alternative mitigation has not been identified.

Response to Comment E-8. Refer to Response to Comment E-7.

Response to Comment E-9. Mitigation Measure 4.2.6.3A already provides for preferential parking for alternative fueled cars. This mitigation located in the Draft EIR, Section 4.2 Air Quality, pages 4.2-26, 4.2-27, and 4.2-28 reads as follows with changes proposed in Section 3.0 Errata in the Final EIR to address other commentor concerns:

> ***4.2.6.3A*** *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and review and approved by the City. The following ~~Any combination of~~ design features~~, including but not limited to the following list, may~~ shall be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:*
>
> - *Lease/purchase documents shall ~~identify that~~ require tenants ~~are encouraged~~ to ~~promote~~ provide the following:*
> - *Provision of preferential parking for EV and CNG vehicles.*

This comment also suggests that the parking lot be required to include porous materials for groundwater recharge. As identified in Table 1.B on page 1-34 of the Draft EIR, impacts associated with groundwater supplies were determined to be less than significant and no mitigation is required. Therefore, there would be no nexus to require this mitigation measure.

Response to Comment E-10. This comment suggests that the World Logistics Project identified as a cumulative project in the Draft EIR was not included in the analysis of the proposed project. The City acknowledges that the World Logistics Project 41,500,000 SF high cube warehouse uses (refer to Table 2.C in Section 2.7 Cumulative Projects on page 2-38 of the Draft EIR). This cumulative project was considered along with the other cumulative projects in Table 2.C in the consideration of traffic impacts on the highway mainline, air quality, greenhouse gas emissions, and loss of agricultural lands in the Draft EIR.

Response to Comment E-11. The ProLogis project is contained in the Draft EIR. It is referred to as the Eucalyptus Industrial Park, cumulative project number 67, shown in Table 2.A and Figure 2.1.

Table 2.C of the Draft EIR identifies the Eucalyptus Industrial Park as A-67, while Figure 2.1 identifies it as M-67. The project is in the City, so the table entry will be modified as follows and as indicated in Section 3.0 Errata in the Final EIR.

Draft EIR, Section 2.7 Cumulative Projects, Table 2.C, Page 34

~~A~~M-67	Eucalyptus Industrial Park	East of Moreno Beach Drive, west of Quincy channel, south of SR-60	2,244,638 SF of high cube warehouse uses

Response to Comment E-12. The nearest schools to the project site are located approximately one mile to the east and northeast of the project site. Because the primary truck route between the project and I-215 will be Harley Knox Boulevard to the west, the trucks will not be passing by a school. In addition, the project is in an area of the City that has been zoned for industrial uses and the proposed project is consistent with this zoning. This sensitive receptor is a residence located at Patterson Avenue and Harley Knox Boulevard in the City of Perris. It should be noted that the entire area surrounding and adjacent to the proposed project has been previously designated and zoned by the City for future industrial uses. Similarly, the entire area surrounding and adjacent to Harley Knox Boulevard between Perris Boulevard and I-215 has been previously designated and zoned by the City of Perris for future commercial and industrial uses. This means that the single residence located

MV00170251

adjacent to Harley Knox Boulevard in the study area is a legally nonconforming land use. Because this residence on Harley Knox Boulevard is a legally nonconforming use, it is highly unlikely that the residence will exist in the area in the future. Thus, in light of these factors, it is highly unlikely that the currently existing residential use will be exposed to diesel over the course of a long period of time, such as a 70 year exposure used to calculate health risks from diesel particulates.

Response to Comment E-13. The project will not impact the health of students walking or riding their bicycles to school because the majority of the residential areas are located to the east of Perris Boulevard and north and northwest and northeast of Perris Boulevard where it passes over the Perris Valley Storm Drain. This area is more than one mile north of the project site. As noted above the primary trucking route will be Harley Knox Boulevard to the west to the I-215 which does not pass by any schools.

Response to Comment E-14. See Response to Comments E-13. There are no sensitive receptors in close proximity to the project site that would be impacted during project construction or by project truck use of the local roadway system. Nonetheless, the EIR contains a measure requiring a 200 foot buffer between construction staging areas and sensitive receptors (Draft EIR Mitigation Measure 4.2.6.1A, page 4.2-21).

Response to Comment E-15. A *Health Risk Assessment (HRA) VIP Moreno Valley*, LSA Associates, Inc., March 2012 was prepared for the proposed project and included in Appendix D-2 to the Draft EIR. The HRA examined the short-term and long-term potential health effects from project-related emissions of toxic air pollutants (TAP) in the exhaust of diesel-powered delivery trucks on existing surrounding sensitive receptors, including single- and multifamily residences. Onsite workers will be protected by the requirements established by the Occupational Safety and Health Administration (OSHA) and are not considered sensitive receptors in accordance to the California Air Resources Board (CARB). The CARB defines "sensitive" land uses, as homes, medical facilities, daycare centers, schools, and playgrounds.

According to the HRA prepared for the proposed project, "*Toxic air pollution emissions associated with the project would occur from a variety of activities related to the project operations. The only significant amount of TAP known to be released from the proposed distribution facility is contained in the exhaust of project-related vehicles. While there may be other toxic air pollutants in use on site, compliance with City, SCAQMD, State, and federal handling regulations will keep those emissions below a level of significance.*

Page 13 of the HRA states, "*As evaluated in the air quality/health risk assessment, practical procedures will be taken for the onsite operations. The results of the conservative modeling are shown in Table C for carcinogenic and chronic inhalation health risks at the sensitive receptors. Even with the conservative modeling technique used (assuming that an individual stays outdoors at his or her residence 24 hours per day for 70 years, which is the State-required period of time that all HRAs must assess), the nearest sensitive receptor would be exposed to an unmitigated inhalation cancer risk of no more than 3.5 in 1 million, less than the threshold of 10 in a million. ……"The highest worker exposure occurs at the facility to the west of the project, at the corner of Indian Street and E. Oleander Avenue. The unmitigated inhalation cancer risk at that facility will be no more than 0.36 in 1 million, also less than the threshold of 10 in a million. The Chronic Hazard Index would be 0.0022, less than the threshold of 1.0. These risk levels are much higher than are actually expected to occur. No significant health risk would occur from project-related truck traffic, and no mitigation is necessary.*"

MV00170252

Table C: Long-Term Health Risk Levels from Project Operations

Location	*Maximum Cancer Risk (risk per million)*	*Maximum Noncancer Risk (risk per million)*
SCAQMD Threshold	*10*	*1*

Source: LSA Associates, Inc., March 2012.

Response to Comment E-16. The Draft EIR, Section 4.2 Air Quality contains the following Mitigation Measure 4.2.6.1K that provides for electric or alternative fuel construction equipment and forklifts and Section 4.3 Greenhouse Gas Emissions and Climate Change contains Mitigation Measure 4.2.6.3A which specifies electric trucks and yard trucks in Mitigation Measure 4.2.6.3A. Changes proposed to Mitigation Measure 4.2.6.1K are provided in Section 3.0 Errata in the Final EIR to address other commentor concerns. The measures are as follows:

> ***4.2.6.1K*** *Grading plans, construction specifications and bid documents shall also include the following notations:*
>
> - *Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;*
> - Use electric construction equipment where feasible.
> - All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.
>
> ***4.2.6.3A*** *Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and review and approved by the City. The following ~~Any combination of~~ design features~~, including but not limited to the following list, may~~ shall be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:*
>
> - *Lease/purchase documents shall ~~identify that~~ require tenants ~~are encouraged~~ to ~~promote~~ provide the following:*
> - *Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.*
> - *Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.*
> - *Use of electric (instead of diesel or gasoline-powered) yard trucks.*

Response to Comment E-17. The Draft EIR, Section 4.4.6.1 Short-Term Construction Noise Impacts page 4.4-17 states "*The nearest noise-sensitive receptor locations to the project site are*

existing residences approximately 1,000 feet to the north. These nearest residents may be subject to short-term, intermittent, maximum noise reaching 65 dBA L_{max}, generated by construction activities on the project site. The ambient noise associated with vehicular traffic and industrial uses in the project area would mask the majority of the construction noise from the project site. No significant construction noise impacts would occur if construction of the proposed project would occur within the permitted hours of 6:00 a.m. to 8:00 p.m. of any working day, and within the permitted hours of 7:00 a.m. and 8:00 p.m. on weekends and federal holidays. Compliance with the construction hours specified in the City's Municipal Code would result in construction noise impacts that are less than significant. While impacts would be considered less than significant as long as construction activities occur within the designated hours identified in the City's Municipal Code, mitigation measures [Mitigation Measures 4.4.6A – 4.4.6D] have been identified to reduce the noise levels that would expose nearby sensitive receptors to noise levels in excess of the City's noise standards."

The noise impact analysis for the proposed project (*Noise Impact Analysis VIP Moreno Valley*, LSA Associates, Inc., March 2012, Appendix F to the Draft EIR) evaluated the traffic noise impact in terms of CNEL and the on-site operations noise impact comparing to the City's Municipal Code noise standards. No exceedance or violation of the noise standards was found and no significant long-term noise impacts would occur. The project site is surrounded by vacant land or other non-noise-sensitive land uses such as industrial or commercial uses. Although the City's Municipal Code states that the noise standards shall apply "when measured at a distance of 200 feet or more from the real property line of the source of the sound if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property", in this case, evaluating the potential noise levels at the property line of the nearest noise-sensitive land uses (i.e., residences) would adequately determine the project's potential noise impacts.

As indicated in the noise impact study, no noise barriers would be required during project construction nor are they required during operation of the proposed project. The proposed project will comply with all mitigation measures identified and comply with applicable federal, State, and City guidelines.

Response to Comment E-18. A Traffic Impact Analysis (*Traffic Study VIP Moreno Valley*, LSA Associates, Inc., April 9, 2012) was prepared for the proposed project that analyzed the proposed project's impacts to area roadways during construction and operation of the project. Draft EIR Section 4.5 Traffic and Circulation, pages 4.5-1 – 4.5-28 analyzed the construction and operational impacts to not only area roadways but on the freeway system as well. It was determined that the proposed project would be expected to generate 327 passenger car equivalent (PCE) trips in the a.m. peak hour, 388 PCE trips in the p.m. peak hour, and 5,052 daily PCE trips when built. It was determined that the proposed project upon build out in the year 2013 would have impacts that are cumulative resulting in exceeding the established LOS standard at the following intersections:

- I-215 Southbound Ramps/Harley Knox Boulevard (a.m. and p.m. peak hours);
- I-215 Northbound Ramps/Harley Knox Boulevard (a.m. and p.m. peak hours);
- Indian Street/South Project Driveway (p.m. peak hour);
- Indian Street/Harley Knox Boulevard (a.m. and p.m. peak hours);
- Perris Boulevard/Gentian Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Iris Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Krameria Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Nandina Avenue (a.m. and p.m. peak hours);
- Perris Boulevard/Grove View Road (a.m. and p.m. peak hours);

- Perris Boulevard/South Project Driveway (a.m. and p.m. peak hours); and
- Perris Boulevard/Harley Knox Boulevard (a.m. and p.m. peak hours).

This is a significant impact and mitigation was provided. It is important to note that ten of the eleven intersections also operate at unsatisfactory levels of service under year 2013 cumulative without the project conditions. The unsatisfactory level of service at the Indian Street/South Project Driveway intersection is considered to be a project-specific impact.

The air quality/health risk assessment has discussed the number of truck trips per day that will visit the project site. Trip length assumptions and the truck routes have also been identified in the analysis. Figure 3 of the Health Risk Assessment report (Appendix D-2: *Health Risk Assessment VIP Moreno Valley*, LSA Associates, Inc., March 2012) shows the location of all the truck emissions sources modeled. As described in the report; *"An approximate representation of the roadway was obtained by placing a number of volume sources at equal intervals along the roads on site and far enough off site to characterize the emissions at the sensitive receptors near the project site. For other sensitive receptors further from the project site but near the roads the trucks will travel, it is assumed that the health risk levels from the project traffic will be low compared to the total risk from all existing road traffic.*"

The Air Quality Study Table I page 26 Appendix D of the Draft EIR indicates the average trip length is 17 miles. This section of the Air Quality study is provided as follows:

5.2.1 Long-Term Project Operational Emissions

Long-term air pollutant emission impacts are those associated with stationary sources and mobile sources involving any project-related changes. The proposed project would result in a net increase in the number of employees in the project area; therefore, the proposed project would result in net increases in both stationary and mobile source emissions. The stationary source emissions would come from additional natural gas consumption for on-site buildings and electricity for the lighting in the buildings and at the parking area. The proposed project is a warehouse/distribution in the Inland Empire area of Southern California. Average truck trip length in this area has been shown to be greater than the default trip length in the CalEEMod model. Table I lists the potential origin and destination points for the truck trips that would be associated with the proposed project. The average trip length for the employee commute is assumed to be 17 mi. This is also greater than the default commute trip length included in the CalEEMod model for the Inland Empire area.

Table I: Average Truck Trips Lengths

Truck Route	*Route Length (miles)*	*Percentage of Trucks on Route*
East on State Route 60 to Basin Boundary	*30*	*10%*
Port of Los Angeles/Long Beach	*80*	*50%*
South on the I-215 to San Diego	*50*	*20%*
Inland Empire (i.e., Ontario, Mira Loma, Fontana)	*50*	*10%*
Perris Destinations	*40*	*5%*
Moreno Valley Destinations	*20*	*5%*
Average Truck Trip (54% of trips)	***61***	

Source: Project Plans

Response to Comment E-19. The trip generation for daily trucks is listed in Table 4.5.D in the Draft EIR, Section 4.5.3.1 Project Trip Generation, page 4.5-14. As shown in Table 4.5.D, the total number of daily trips (total raw trucks) is 1,475. The number of daily truck trips is based on NAIOP rates for High-Cube Warehouse that were approved by the City of Moreno Valley.

Response to Comment E-20. Freeway segment and merge/diverge analysis locations are based on Caltrans guidelines which requires analysis to a State highway facility if a project generates over 100 peak hour trips[1]. The project generates over 100 peak hour trips at the Interstate 215/Harley Knox Boulevard interchange and was included in the Draft EIR. Project traffic at freeway segments on SR-60 are less than 100 peak hour trips and were not included in the Draft EIR.

Regarding commenters opinion that payment of DIF and TUMF is inadequate mitigation, please refer to Response to Comment D-82. The payment of DIF and TUMF fees is considered the appropriate mechanism for the project to contribute to future roadway improvements, resulting in full and complete mitigation of project-specific impacts.

Response to Comment E-21. The commentor opines that the project site should not be disced or graded for at least six months prior to doing the burrowing owl survey. Mitigation Measures BIO-1 through BIO-4 require pre-construction surveys and establish what actions must be taken if the burrowing owl is found on-site during the pre-construction surveys that are in accordance with the Burrowing Owl Consortium 1993 Burrowing Owl Survey Protocol and Mitigation Guidelines[2] and referred to the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) survey instructions[3] to complete the pre-construction burrowing owl survey.

Response to Comment E-22. This comment states that the Final EIR will be inadequate unless the concerns and issues identified in the comment letter are addressed within the document. This comment does not raise any specific issue associated with the Draft EIR. In addition, any concerns and issues identified in the comment letter have been addressed through Responses E-1 through E-62 of the Final EIR. No further response is required.

Response to Comment E-23. Draft EIR Section 4.3 Climate Change and Greenhouse Gas Emissions, pages 4.3-1 – 4.3-27 provides an analysis of the proposed project's impact on greenhouse gas emissions and climate change. The analysis is based on the *Greenhouse Gas Emissions and Global Climate Change Study*, LSA Associates, Inc., December 2011 included as an Appendix D in the Draft EIR. Responses to Comments E-24 through E-54 include specific responses to the commentor's assertions that the Draft EIR did not thoroughly evaluate alternatives and mitigation measures that would reduce greenhouse gas emissions. Where appropriate additional mitigation measures have been add to the Section 3.0 Errata in the Final EIR.

Response to Comment E-24. The commentor opines that global warming poses a grave threat to California and the Draft EIR is obligated to discuss the threats posed by greenhouse gas emissions for the public and decision makers. Page 4.3-1 through 4.3-3 in the Draft EIR (Section 4.3 Climate Change and Greenhouse Gas Emissions) already established the existing background information related to climate change as requested in this comment.

The commenter suggests that there is consensus among scientists regarding the link between GHG and global warming. However, there is still considerable debate about the existence of anthropogenic global warming, and about the long term environmental effects of anthropogenic global warming if in fact such warming is occurring and will occur long term. (*See, e.g., U.S. Senate Minority Report; More Than 700 International Scientists Dissent Over Man-Made Global Warming Claims*; March 16, 2009.)

---

1 *Guide for the Preparation of Traffic Impact Studies*, State of California Department of Transportation, December 2002, page 2.

2 http://www2.ucsc.edu/scpbrg/burrowingowls.htm.

3 http://www.tlma.co.riverside.ca.us/epd/documents/survey_protocols/burrowing_owl_survey_instructions.pdf.

This body of scientific literature argues that (i) there is no scientific consensus on the existence of anthropogenic global warming; (ii) that the Intergovernmental Panel on Climate Change (IPCC) literature is deeply flawed; (iii) that scientists and research grant funding sources have deliberatively ignored other possible explanations in global temperature variations.

In addition, quantitative data published by the State Air Resources Board and the IPPC demonstrates that even if California achieved the specified AB 32 greenhouse reduction goals, that this may have no effect on climate increases based on greenhouse gas emissions because emissions from China, Russia, Indonesia and other developing countries have and will greatly surpass the emissions of California.

Response to Comment E-25. Draft EIR Section 4.3 Climate Change and Greenhouse Gas Emissions, pages 4.3-1 – 4.3-27 provides an analysis of the proposed project's impact on greenhouse gas emissions and climate change. The analysis is based on the *Greenhouse Gas Emissions and Global Climate Change Study*, LSA Associates, Inc., December 2011 included as an Appendix D in the Draft EIR. In addition, the commentor asserts that the "ecological implications of its actions" must be discussed. Also refer to Response to Comment E-38 for an explanation on a recent court case regarding global climate change. As set forth in Response to Comment E-38, the courts have confirmed the longstanding tenant of CEQA that impacts from the environment onto a project need not be analyzed.

Response to Comment E-26. Please see Responses to Comments E-25, E-27, and E-38.

Response to Comment E-27. The commentor is providing information relating to the scientific background on climate change and global warming. See Response to Comment E-24 regarding an alternative view of greenhouse gas emissions and the effect of such emissions.

Response to Comment E-28. Section 4.3 Climate Change and Greenhouse Gas Emissions, Subsection 4.3.2 Regulatory Setting in the Draft EIR pages 4.3-7 through 4.3-11 contains a discussion on the various federal, state, local and City laws, regulations and policies concerning greenhouse gas.

Response to Comment E-29. The greenhouse gas impact study (*Greenhouse Gas Emissions and Global Climate Change Study*, LSA Associates, Inc., December 2011) provided emissions from both construction and operation periods. During the construction period, emissions from both equipment exhaust and other area sources were calculated. During the operational period, emissions associated with vehicular (including automobiles and trucks) trips, water and energy usage, waste treatment, and other known sources have been calculated and identified in the study.

Response to Comment E-30. Please see Response to Comment E-29. All known emissions during construction and operations of the proposed project have been identified and calculated.

Response to Comment E-31. Please see Response to Comment E-29. All known emissions during construction and operations of the proposed project have been identified and calculated.

Response to Comment E-32. Please see Response to Comment E-29. All known emissions during construction and operations of the proposed project have been identified and calculated. If the commentor is suggesting that an exhaustive "life-cycle" inventory of the project's greenhouse gas

emissions be prepared, the State Office of Planning and Research provided guidance on this issue and clarified that a life-cycle analysis is not required.[1]

Response to Comment E-33. Please see Response to Comment E-29.All known emissions during construction and operations of the proposed project have been identified and calculated.

Response to Comment E-34. Please see the Response to Comment E-29. All known emissions during construction and operations of the proposed project have been identified and calculated. The preparer of the greenhouse gas impact study has followed the guidelines provided by the OPR and CAPCOA and has provided an adequate analysis. It is the City's opinion that it has disclosed the impacts of the proposed project adequately and mitigated the impacts of greenhouse gas emissions where applicable (Draft EIR Section 4.3 Climate Change and Greenhouse Gas Emissions, pages 4.3-1 – 4.3-27).

Response to Comment E-35. The commentor points out that existing conditions must be utilized as the environmental baseline throughout the Draft EIR. The Draft EIR does just this by calculating and presenting the air pollution and greenhouse gas emissions attributable to the proposed project. Because there is currently no land use activity on the project site, existing baseline emissions are zero. Consequently, the calculated emissions represent the emissions associated with the project.

Response to Comment E-36. The project will not be built over a long period of time. There is no phasing proposed with the development. The commentor is confused, the project is not a planned community, it is an approximately 1,616,133 square feet of distribution warehouse (refer to Draft EIR, Section 3.0 Project Description). There is no reason to evaluate the emissions of the proposed project over five year increments since the building will be built all within the same year.

Response to Comment E-37. It is the commentor's opinion that the Draft EIR does not provide a complete inventory of impacts. The Draft EIR evaluated the impacts of the project on air quality (Section 4.2) and greenhouse gas emissions and global climate change (Section 4.3). In addition a full air quality study and greenhouse gas emissions study were prepared for the proposed project and included in their entirety in the Appendix to the Draft EIR. No further response is required.

Response to Comment E-38. According to the greenhouse gas impact study (*Greenhouse Gas Emissions and Global Climate Change Study*, LSA Associates, Inc., December 2011), "*Global climate change is the observed increase in the average temperature of the Earth's atmosphere and oceans along with other significant changes in climate (such as precipitation or wind) that last for an extended period of time. The term "global climate change" is often used interchangeably with the term "global warming," but "global climate change" is preferred to "global warming" because it helps convey that there are other changes in addition to rising temperatures."* The Draft EIR did analyze the project's effects on greenhouse gas emissions which is a component of global climate change or global warming (Section 4.3 Climate Change and Greenhouse Gas Emissions, pages 4.3-1 – 4.3-27).

In addition, the California requires mandatory measures to be implemented on all new construction projects that consist of a wide array of green measures concerning project site design, water use reduction, improvement of indoor air quality, and conservation of materials and resources. The Cal Green Building Code refers to Title 24, Part 6 compliance with respect to energy efficiency; however, it encourages 15 percent energy use reduction over the required in Part 6. The Cal Green Code prescribes a wide array of measures that would directly and indirectly result in reduction of GHG

---

1 *Transmittal of the Governor's Office of Planning and Research's Proposed SB97 CEQA Guidelines Amendments to the Natural Resources Agency*, California Governor's Office of Planning and Research, April 13, 2009, page 2.

emissions from the Business as Usual Scenario (California Building Code). The mandatory measures that are applicable to nonresidential projects include site selection, energy efficiency, water efficiency, materials conservation and resource efficiency, and environmental quality measures.

If the commentor is suggesting that the Draft EIR should analyze global warming on the proposed project there is a a recent CEQA Case *Ballona Wetlands Land Trust v. City of Los Angeles and Ballona Ecosystem Education Project v City of Los Angeles,* No.B231965 (Cal. Ct. App 2d Dist., November 9, 2011) where the opponents claimed that the EIR was inadequate because it did not analyze the effects of sea rise due to global warming on the project. The Court held that CEQA did not require the EIR to analyze this risk, concluding that "the purpose of an EIR is to identify the environmental effects of the project on the environment and not the significant effects of the environment on the project." The court reasoned: "[w]e believe that identifying the environmental effects of attracting development and people to an area is consistent with CEQA's legislative purpose and statutory requirements, but identifying the effects on the project and its users of locating the project in a particular environmental setting is neither consistent with CEQA's legislative purpose not required by CEQA statutes." Therefore an analysis of the effects of global climate change on the project is not appropriate and is not required.

Response to Comment E-39. Refer to Response to Comment E-38.

Response to Comment E-40. Refer to Response to Comment E-38.

Response to Comment E-41. As stated in Response to Comment E-38, CEQA does not require that the effects of global climate change on the project and other environmental resources must be analyzed in the EIR. CEQA does require that the proposed project's effects on greenhouse gas emissions and global climate change must be addressed. This analysis was provided in Section 4.3 Greenhouse Gas Emissions and Global Climate Change in the Draft EIR. The Draft EIR did analyze the significant effects on air quality (Section 4.2), water supply (Section 2.0), flood hazards (Section 2.0) and biological resources (Section 2.0) and provided mitigation to reduce those impacts where feasible.

Response to Comment E-42. The Draft EIR analyzed the cumulative effects of the project on greenhouse gas emissions (Section 4.3.7 Cumulative Impacts, page 4.3-26) and it was determined that "*While it is not possible to determine whether the project individually will have a significant impact on global warming or climate change, it will contribute to cumulative GHG emissions in California. Cumulatively, the build out of the proposed project would contribute approximately 0.044 metric tons of CO_2e per year, which is 0.009 percent of California's existing total emissions for carbon dioxide, methane, and nitrous oxide (478 metric tons of CO_2e per year). The mitigation measures discussed above will likely reduce the project's emissions of greenhouse gases; however, without the necessary science and analytical tools, it is not possible to determine with certainty whether the project's emissions of greenhouse gases will be cumulatively considerable, within the meaning of CEQA Guidelines Sections 15065(a)(3) and 15130. The CARB is currently in the process of designing regulations to monitor, limit, and ultimately reduce California GHG emissions but there are as yet no adopted standards for assessing the significance of cumulative impacts from projects.*

Cumulatively, the emissions from electricity production would comprise approximately 3.4 percent of the project's total CO_2e emissions. Water usage and solid waste disposal emissions comprise approximately 18 percent of the project's total CO_2e emissions while the emissions from vehicle exhaust would comprise approximately 77 percent of the project's total CO_2e emissions. The emissions from vehicle exhaust are controlled by the State and Federal governments and are outside the control of the City. The remaining CO_2e emissions are primarily associated with building systems. The proposed project is required to comply with existing State and Federal regulations regarding the energy efficiency

of buildings, appliances, and lighting, which would reduce the project's electricity demand. The new buildings constructed in accordance with current energy efficiency standards would be more energy efficient than older buildings.

With implementation of the strategies and programs described previously, the project is consistent with the strategies to reduce California's emissions to the levels proposed in Executive Order S-3-05. However, given the uncertainty of data and appropriate methodology to accurately analyze, and the inability to quantify the reduction achieved through implementation of strategies and programs previously identified, the proposed project's GHG emission contribution would result in a cumulative impact regarding global climate change and the cumulative impacts of the proposed project on global climate change are considered to be significant and unavoidable."

The Draft EIR did analyze the cumulative effects of the project on greenhouse gas emissions and determined the impacts on global climate change are considered to be significant and unavoidable.

Response to Comment E-43. To clarify, the project is not subject to NEPA and the environmental documentation that was completed is under CEQA. The findings or rulings under NEPA do not apply in this case; however, State CEQA Guidelines Section 15064(b) provides that "…the determination of whether a project may have a significant effect on the environment calls for careful judgment on the part of the public agency involved, based to the extent possible on scientific and factual data," and further, that an "ironclad definition of significant effect is not always possible because the significance of an activity may vary with the setting." The State CEQA Guidelines further indicate that even when thresholds are established, they may include "identifiable quantitative, qualitative or performance level of a particular environmental effect" (State CEQA Guidelines, Section 15064.7).

Furthermore, the Draft EIR page 4.3-26 as modified in this Final EIR, determined "*project-related GHG emissions and their contribution to global climate change impacts in the State are less than significant ~~and less than cumulatively considerable~~* on a project specific basis *because: (1) the project's impacts alone would not cause or significantly contribute to global climate change, and (2) the project has no substantial effect on consumption of fuels or other energy resources, especially fossil fuels that contribute to GHG emissions when consumed.*

The Draft EIR (Section 4.3) made a determination that the proposed project would not conflict with any applicable plan, policy, or regulation of an agency adopted for the purpose of reducing the emissions of greenhouse gases and no mitigation is required. However, it was determined that the proposed project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment and mitigation was proposed to reduce these project-specific effects to less that significant (Draft EIR, page 4.3-21 – 4.3-26).

It should be noted that any GHG emissions reductions achieved locally and within the State may be offset by emissions increases in developing countries such as Brazil, Russia, India and China. In the absence of worldwide reduction commitments that are fully funded, any project level reduction measures cannot assure that significant effects from greenhouse gas emissions will be fully mitigated because significant impacts from greenhouse gas emissions may occur even with implementation of the measures set forth in CARB's AB 32 Scoping Plan.

Response to Comment E-44. Refer to Response to Comment E-43.

Response to Comment E-45. Refer to Responses to Comments E-42 and E-43.

Response to Comment E-46. As the comment is the opinion of the commentor the City is not in the position nor is it reasonable to adopt a "zero" significance threshold. SCAQMD and other air quality

agencies agree that GHG and climate change should be assessed as a potentially significant "cumulative impact" rather than a "project-specific" impact. SCAQMD is considering the adoption of a numeric plan-level efficiency target of 6.6 MTCO2E per service population.

The intent of CEQA is to determine the significant effects of a project on the environment and provide feasible and reasonable mitigation to reduce impacts to less than significant. In instances where the impact of the project cannot be reduced to less than significant and it is determined the impact is significant and unavoidable, the Lead Agency, must adopt a Statement of Overriding Considerations that finds (1) under Public Resources Code Section 21081(a)(3), and CEQA Guidelines Section 15091(a)(3), that specific economic, legal, social technological, or other considerations, including provisions of employment opportunities to highly trained workers make infeasible the mitigation measures or project alternatives identified in the Final EIR; and (2) under CEQA Guidelines section 15092(b), that the remaining significant effects are acceptable due to overriding concerns described in the CEQA Guidelines Section 15093. CEQA does have a provision as stated above that an impact can be significant and unavoidable if the City makes findings as to why it is willing to accept the significant impact; therefore, it was not CEQA's intent to not allow any tolerance for impacts on the environment as long a good faith effort is made to reduce the impacts where reasonable.

Response to Comment E-47. See Response to Comment D-8. Mitigation Measure 4.2.6.3.A (Draft EIR page 4.2-26) requires "Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:" With implementation of this measure, the building will meet a 20% reduction in energy performance standard which will render greenhouse gas emissions impacts to a less than significant level on a project-specific basis and consistent with the intention of AB32. It should be noted, however, that many new mitigation measures have been added in the Final EIR. Please refer to the Table contained in Response to Comment D-45 regarding air quality operational mitigation measures as well as indicated in Section 3.0 Errata in the Final EIR.

Response to Comment E-48. Riverside Transit Authority (RTA) has an established bus route, No. 19, which services the project area and the site. The RTA has two stops one on either side of Perris Blvd. and Grove View Rd. From the project site the walk north along Perris Blvd. is approximately 0.2 mile to a stop at Perris Blvd and Nandina. There is another bus stop at 17800 Perris Blvd. approximately 0.1 mile from the project site. Therefore, the site is serviced by the RTA and no further actions are necessary. However, a bus bay has been included in the project design along the site's Perris frontage.

The commentor is erroneously confusing this project which is a distribution warehouse with a mixed use or commercial project that would have residents living within the project area. It is not appropriate to include plazas and pedestrian and bicycle only streets within the project and to create routes that will allow residents to reach the commercial center, schools and parks by public transportation, bicycling and walking as suggested by the commentor. The project is not building transportation routes. The project is located on existing roadways, Perris Boulevard, Indian Street, and Grove View Road.

Response to Comment E-49. The commentor is erroneously confusing the proposed project, which is a high-cube logistics distribution warehouse, by inferring that it is a planned community with a residential component. Nonetheless, the warehouse building will be required to incorporate many green building techniques required as part of Mitigation Measures 4.2.6.3A-4.2.6.3B and 4.3.6.1A-4.3.6.1C.

Response to Comment E-50. The commentor is erroneously confusing the proposed project, which is a high-cube logistics distribution warehouse, by inferring that it is a residential project. Nonetheless,

please see the response to Comments E-29 and E-32. All known emissions during construction and operations of the proposed project have been identified and calculated (Draft EIR Section 4.3 Climate Change and Greenhouse Gas Emissions, pages 4.3-1 – 4.3-27).

Response to Comment E-51. See Response to Comments D-8 and E-47.

Feasible mitigation measures, including several identified in the list provided by the commentor, have been already included as mitigation for the project and are identified in the Draft EIR. In addition, the mitigation measures shown as "Incorporated" in the following Table have been added to the Final EIR (Section 3.0 Errata) as suggested by the commentor. The changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the EIR. The Table below contains each of the greenhouse gas reduction measures suggested for inclusion by the commentor and if it is already included, if will be added mitigation as part of the Final EIR, or if will not be included and why.

Suggested Mitigation Measure	Response
1. Analyzing and incorporating the U.S. Green Building Council's LEED (Leadership in Energy and Environmental Design) or comparable standards for energy efficient building during pre-design, design, construction, operations and management.	**Incorporated.** The project description states In recognition of the trend towards Green Building, the proposed project will pursue the Leadership in Energy and Environmental Design (LEED) Core & Shell rating program. LEED is a voluntary, consensus-based standard to support and certify successful green building design, construction, and operations.
2. Designing buildings for passive heating and cooling, and natural light, including building orientation, proper orientation and placement of windows, overhangs, skylights, etc.	**Included.** A similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
3. Designing buildings for maximum energy efficiency including the maximum possible insulation, use of compact florescent or other low-energy lighting, use of energy efficient appliances, etc.	**Included.** A similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
4. Reducing the use of pavement and impermeable surfaces.	**Included where appropriate.** Impermeable surfaces will be installed were appropriate but it is not feasible to use impermeable surfaces in the truck parking area since a soft permeable surface will not support the weight of a large truck.
5. Requiring water re-use systems.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1C** on page 4.3-25.
6. Installing light emitting diodes (LEDs) for traffic, street and other outdoor lighting.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1A** on page 4.3-24.
7. Limiting the hours of operation of outdoor lighting.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
8. Maximizing water conservation measures in buildings and landscaping, using drought tolerant plants in lieu of turf, planting shade trees.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
9. Ensure that the Project is fully served by full recycling and composting services.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3B** on page 4.2-28.
10. Ensure that the Project's wastewater and solid waste will be treated in facilities where greenhouse gas emissions are minimized and captured.	**Infeasible.** The site is served by public entities for wastewater and solid waste, Neither the City nor the project proponent has control over those facilities.

MV00170262

Suggested Mitigation Measure	Response
11. Installing the maximum possible photovoltaic array on the building roofs and/or on the project site to generate all of the electricity required by the Project, and utilizing wind energy to the extent necessary and feasible.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1A** on page 4.3-24.
Mitigation Related to Construction	
1. Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials.	**Included.** A similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1B** on page 4.3-25.
2. Minimize, reuse, and recycle construction-related waste.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1A** on page 4.3-24.
3. Minimize grading, earth-moving, and other energy-intensive construction practices.	**Infeasible.** The entire site must be graded to accommodate the building structure and parking lot.
4. Landscape to preserve natural vegetation and maintain watershed integrity.	**Infeasible.** The site does not contain natural/native vegetation**.**
5. Utilize alternative fuels in construction equipment and require construction equipment to utilize the best available technology to reduce emissions.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measures 4.2.6.1B, 4.2.6.1I, and 4.2.6.1K** on pages 4.2-21- 4.2.22.
6. Utilize recycled, low-carbon, and otherwise climate-friendly building materials such as salvaged and recycled-content materials for building, hard surfaces, and non-plant landscaping materials.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.3.6.1B** on page 4.3-25.
Transportation Mitigation Measures	
1. Encourage and promote ride sharing programs through such methods as a specific percentage of parking spaces for ride sharing vehicles.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
2. Create a car sharing program within the planned community;	**Not required.** The project is not a planned community. . As noted in **Mitigation Measure 4.2.6.1K**, documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs.
3. Create a light vehicle network, such as a neighborhood electric vehicle (NEV) system.	**Included.** This suggested mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27.
4. Provide necessary facilities and infrastructure to encourage residents to use low or zeroemission vehicles, for example, by developing electric vehicle charging facilities and conveniently located alternative fueling stations.	**Included.** A similar mitigation measure is already included in Section 4.2 Air Quality of the Draft EIR under **Mitigation Measure 4.2.6.3A** on page 4.2-27. The mitigation measure the commentor suggests relates to "residents". This project is a high-cube warehouse not a residential development.
5. Provide a shuttle service to public transit within and beyond the planned community.	**Not required.** The RTA has two stops one on either side of Perris Blvd. and Grove View Rd. From the project site the walk north along Perris Blvd. is approximately 0.2 mile to a stop at Perris Blvd and Nandina. There is another bus stop at 17800 Perris Blvd. approximately 0.1 mile from the project site. Therefore, the site is serviced by the RTA and no further actions are necessary. However, a bus bay has been included in the project design along the site's Perris frontage.

Suggested Mitigation Measure	Response
6. Incorporate bicycle lanes and routes into the planned community's street systems.	**Not required.** Bicycle access to and from the project will take place from the adjacent streets In addition the project is not a planned community.

Response to Comment E-52. See the Table included in the Response to Comment E-51 under "Mitigation Related to Construction" Items 1-6.

Response to Comment E-53. See the Table included in the Response to Comment E-51 under "Transportation Mitigation Measures" Items 1-6.

Response to Comment E-54. The use of carbon offsets are infeasible because:

- The cited precedent is a negotiated settlement for a major oil refinery in Contra Costa County, rather than a warehouse development in Riverside County;
- The cited precedent was for the period prior to 2012;
- California has not established any generally applicable standards for requiring offsets for GHG emissions; and
- Most cities and counties in California have not required offsets for GHG emissions on projects of the scale of the proposed project. Since this is a cumulative rather than a project level impact, mitigation for the cumulative level impact will be ineffective unless it is applied to all the cumulative projects.

Using such carbon offsets to mitigate for cumulative impacts is fraught with uncertainty. As the comment implies ("… offsets purchased are real…"), but there is considerable controversy regarding whether offsets that are available today will actually mitigate this cumulative effect.

First, it requires an accurate measure of the emissions to be offset and the offsets to be provided. That calculation turns out to be riddled with uncertainty on both ends. As noted above in the example cited by the commenter, this initial offset of $7 million for the Rodeo refinery was later reduced to $4.4 million due to revised calculations of GHG emissions. The UN's Intergovernmental Panel on Climate Change found a margin of error of 10% with measuring emissions from making cement or fertilizer; 60% with the oil, gas and coal industries; and 100% with some agricultural processes.

Second, the provision of offsets requires an accurate measure of the carbon saved elsewhere. Most of the earliest offset projects involved planting trees, which naturally ingest carbon, a complex and unpredictable process which forbids accurate measurement.

Finally, the very idea of offsetting relies on what is known as additionally - evidence that a carbon reduction would not have occurred in the natural order of commercial life. For example, one of the biggest UK companies that sells offsets, Climate Care, distributed 10,000 energy-efficient light bulbs in a South African township; offered the carbon reductions as offsets; and then discovered that an energy company was distributing the same kind of light bulbs free to masses of customers, including their township, so the reduction would have happened anyway.

To accurately calculate the amount of credit for each of the above actions, the offset program must make a number of critical assumptions:

- What is the baseline of emissions for the existing facilities that would be retrofitted to reduce their energy consumption? Would they ultimately be retrofitted in any case, thus limiting the actual resulting reduction in GHG emissions?

- Is the development of the alternative energy source actually dependent on the external funding provided by the offset? Or is the alternative energy developer simply achieving another subsidy?

- How much extra energy (and GHG emissions) is required to construct the alternative energy facility? What period of time should this be amortized over? For example, the development of the California High Speed Rail Project is estimated to reduce energy consumption in the long run. However, the extra energy involved with construction is estimated to have a 40 year payback.

As such, the actual amount of mitigation provided by an offset program can be speculative, based upon the actual performance of the program.

While the above cited issues with offsets are problematic, even if they are successful, they are based upon the assumption that a 1:1 reduction in emissions will actually result in the same reduction in global CO2 values. This static analysis fails to take into account the dynamic nature of energy consumption worldwide. When energy consumption (a proxy for GHG emissions) is reduced in one location, there are powerful economic reasons to assert that the same energy consumption (GHG emissions) will simply be shifted to another location.

There is a global marketplace for fossil fuel energy based upon a market between buyers and sellers. The sellers, those who own the sources and production of fossil fuel energy, have a powerful economic interest to keep and increase their income stream from the production of fossil fuels.

To the extent that the actions cited above as potential offset measures, in combination with other conservation measures, reduce the demand for fossil fuels in the countries where they are implemented, the owners of these fossil fuel supplies will still want to preserve and enhance their income as much as possible. And there is a large unmet need (unmet as defined by consumer actions) for increased energy consumption in developing countries. For example the average annual energy consumption of a citizen of China or sub-Saharan Africa, at 4.5 metric tons, is far less than that of the average US citizen, at 20 metric tons. To the extent that the US and other countries reduce energy consumption based upon energy efficiency measures, the owners of fossil fuel resources will seek to sell the same energy, perhaps at a lower price, to the less developed countries. If the energy is sold at a lower price, then more energy would need to be sold to generate the same income, and the resulting energy consumption and GHG emissions could actually increase.

There is uncertainty regarding the efficacy, reliability and legal standing of carbon off-sets at this time. For this reason, such mitigation is considered to be infeasible.

Response to Comment E-55. The commentor is correct in stating that the EIR must contain a "*reasonable*" [emphasis added] range of alternatives to the proposed project that avoid or lessen the significant impacts to the proposed project (Pub. Res. Code §21002; CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126.6(d)). According to CEQA Guidelines §15126.6(a) "[A]n EIR need not consider every conceivable alternative to a project. An EIR is not required to consider alternatives which are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of

reason. (Citizens of Goleta Valley v. Board of Supervisors (1990) 52 Cal.3d 553 and Laurel Heights Improvement Association v. Regents of the University of California (1988) 47 Cal.3d 376)."

The Draft EIR does include an analysis of a reasonable range of alternatives to the proposed project (Section 6.0 Alternatives, pages. 6-1 – 6-33) incompliance with CEQA. The Draft EIR discusses the No Project Alternative (Section 6.3.2.1) and an Off-Site Alternative (Section 6.3.2.4) as suggested by the commentor.

Response to Comment E-56. The commentor is misinterpreting the Draft EIR or has failed to understand that the proposed project is not a higher density mixed use commercial/residential project. The project analyzed in the Draft EIR is an industrial project (refer to Draft EIR Section 3.0 Project Description) which is consistent with the General Plan Designation of Business Park/Light Industrial. Zoning for the site and surrounding area in the City is governed by Specific Plan (SP) 208. SP 208, which is known as the Moreno Valley Industrial Area Plan, was originally adopted in 1989, amended in 2001 and 2002. The entire area surrounding the project site is zoned SP 208 which has planned the area for business park and industrial uses since 1989 (23 years). The area to the south in the City of Perris is also planned for industrial and commercial uses. Clearly, the Cities of Moreno Valley and Perris have planned this area for industrial/business park and commercial uses in their respective General Plans for years. The City has already determined the appropriate lands uses for the area and conducted the appropriate CEQA review for that determination. This project implements that prior determination consistent with the existing general plan and specific plan.

If the commentor is suggesting that a high density mixed use commercial/residential project be considered as an alternative to the proposed project, the Draft EIR Section 6.3.2.3, page 6-22 does include an analysis of Alternative 3 Mixed Use Commercial Office Center. A Mixed Commercial/Residential Alternative was analyzed in Section 6.2.3 and it was determined *[t]hat the mixed commercial/residential alternative would not meet the project objectives of providing new employment and revenue generation options in close proximity to local consumers to the same degree as the proposed project. The employment opportunities and economic benefits derived from the proposed project are superior to the Mixed Commercial/Residential Alternative. This alternative has been rejected because it would result in greater impacts and would not satisfy the basic City objectives for development of the project site.*

Also refer to Response to Comment D-96.

Response to Comment E-57. The Draft EIR does analyze the various alternatives impacts on greenhouse gas emissions (Table 6.G page 6-16) biological resources, water resources including water quality and water availability(Table 6.E page 6-16) and traffic (Table 6.C page 6-15). In addition, detailed analysis for each of the alternatives is proposed in Draft EIR Sections 6.3.1.1, 6.3.1.2, 6.3.1.3 and 6.3.1.4 on pages. 6-12 – 6-31 as it related to the environmental issues listed by the commentor. An agricultural alternative was not considered because the site has been planned by the City since 1987 for industrial land uses. In addition the current General Plan does not include any agricultural designations. The City allows agricultural uses in all land use designations as an interim use until such time as the land is developed per the vision identified in the General Plan. One of the goals stated in the City's recent General Plan is the "…orderly conversion of agricultural lands." Therefore, an agricultural use as an alternative is not a practical alternative that requires analysis. No further analysis is necessary and the comment does not change the conclusion in the Draft EIR.

Response to Comment E-58. This is the commentor's opinion and is not relevant to the analysis in the Draft EIR. However, the Draft EIR, Section 3.0 Project Description, page 3-1, states that "*The proposed project site has been used historically for agricultural purposes but currently lies fallow. It*

was most recently used as a sod farm growing that ceased operating in August 2005." The site has not been farmed over the last seven years.

Response to Comment E-59. A less dense alternative (which is to assume an alternative that considers a building of less square footage) is analyzed in the Draft EIR as Alternative 2. In this Alternative, warehouse uses would be reduced to 1,212,100 square feet on 71 acres. It was determines that Alternative 2 would be the environmentally superior alternative and it would have similar impacts as the proposed project on: agriculture and forestry resources, biological resources, cultural resources, geology and soils, hazards and hazardous materials, hydrology and water quality, mineral resources and recreation (Draft EIR Section 6.3.2.2 Alternative 2: Reduced Intensity , pages 6-17 – 6-22). It was concluded on page 6-21 that [*U]nder the Reduced Intensity Alternative, impacts related to short-term construction-related air quality would be similar to the proposed project as the same amount of land would be disturbed and the same mix of equipment would be utilized. Long-term operational-related air quality impacts would be reduced in magnitude when compared to the project but would remain significant and unavoidable. The decrease in warehouse uses would result in a reduction of permanent jobs that would be created. This alternative would have a reduced demand on public services and utilities and service systems. However, similar to the proposed project, the payment of fees and adherence to utility requirements would reduce these impacts to a less than significant level.*

Because of the decrease in vehicle trips achieved under this alternative, impacts to the operation of local roadways and intersections would be proportionally reduced from what was identified for the proposed project; however, long-term traffic impacts would remain significant and unavoidable. Construction-related noise would be similarly mitigated like the proposed project and would remain less than significant. Water use for this alternative would be less than the proposed project and would generate less wastewater and solid waste. Under this alternative, the proposed project objectives are met and warehouse uses would still be built, but on a smaller scale.

As stated above, the Reduced Intensity Alternative would reduce the intensity of some impacts of the proposed project. However; loss of farmland, long-term air quality, greenhouse gas emissions cumulative impacts, and long-term traffic impacts would remain significant and unavoidable. The Reduced Intensity Alternative is a reduction in actual size of the warehouse but the significant unavoidable impacts of the proposed project are not reduced to less than significant.

Additionally, the Reduced Intensity Alternative would not meet the following project objectives: "Provide a high density, high-quality large-scale industrial development to provide jobs for residents at a variety of income levels" and "Cluster industrial warehouse uses near efficient access points to the state highway system to reduce traffic congestion on surface streets and to reduce concomitant air pollutant emissions from vehicle sources reduces impacts to air quality, global climate change, and traffic." This is due to the fact that reduced-intensity development patterns are in concept diametrically opposite of the highly dense form of development patterns that are characteristic of clustered development. Development of the project site in such an inefficient manner would result in negative effects such as sprawl leading to increased VMT and associated air pollution and greenhouse gas emissions.

Response to Comment E-60. The City has fully responded to the commentor's concerns and comments and others who had submitted comments on the Draft EIR. The Final EIR is conformance with CEQA Guidelines §§ 15090, 15091, and 15132. In addition, the significant impacts of the proposed project have been analyzed in Section 4.1 through Section 4.5 in the Draft EIR and mitigation proposed for those impacts that were found to be significant. For those impacts for agriculture, air quality, greenhouse gas emissions, and traffic that were determined to be significant and unavoidable the City would have to adopt findings and a statement of overriding considerations

that the state the specific economic, legal, social technological, or other considerations, outweigh the significant unavoidable effects of the proposed project.

Response to Comment E-61. The City has included the Sierra Club on its mailing list for all future notices and documents regarding this project.

Response to Comment E-62. The commentor has attached various references. No response is required.

Moreno Valley, CA 92552

Notice of availability DEIR for the VIP Moreno Valley. Riv-215-PM 32.62

Dear Mr. Bradshaw,

We have completed our review for the above noted project which is a 1,616,133 square foot warehouse distribution building on a 71.13 net acre site. The building includes 268 dock high doors and 44,000 square feet of office area in four potential office locations. Located within the Moreno Valley Industrial Area Plan (SP 208) at the City's southern boundary, between Perris Boulevard and Indian Street and between Grove View Road and the Perris Valley storm channel Tentative Parcel Map No. 36162 is proposed to combine four existing parcels into a single parcel for development of the 1.6 million square warehouse facilities. 1

As the owner and operator of the State Highway System (SHS), it is our responsibility to coordinate and consult with local jurisdictions when proposed development may impact our facilities. As the responsible agency under the California Environmental Quality Act (CEQA), it is also our responsibility to make recommendations to offset associated impacts with the proposed project. Although the project is under the jurisdiction of the City of Moreno Valley due to the Project's potential impact to State facilities it is also subject to the policies and regulations that govern the SHS. 2

We recommend the following: however, additional comments maybe forth coming. 3

Traffic Forecasting

Appendix G- Traffic Study VIP Moreno Valley page 6, Under section "Existing Without Project Traffic Volumes" please use year 2007 for Caltrans AADT volume data which can be found online. This will keep the consistency in traffic volume projections.

Appendix G- Traffic Study VIP Moreno Valley page 7, Under section "Existing Without Project Traffic Volumes" please specify which year(s) have been used to determine the D and K factors derived from Caltrans data. 4

We appreciate the opportunity to offer comments concerning this project. If you have any questions regarding this letter, please contact Talvin Dennis at (909) 383-6908 or myself at (909) 383-4557 for assistance.

"Caltrans improves mobility across California"

Sincerely,

DANIEL KOPULSKY
Office Chief
Community Planning/IGR-CEQA

2.14 RESPONSE TO LETTER F

California Department of Transportation, District 8

Response to Comment F-1. The commentor has accurately summarized the general aspects of the proposed project.

Response to Comment F-2. The comment is introductory and states that the California Department of Transportation (Caltrans) is the owner and operator of the State Highway System as is a "responsible agency" pursuant to Public Resources Code Section 21070 for making recommendations to offset associated traffic impacts with the proposed project.

The comment is introductory in nature and outlines Caltrans' authority and role as a commenting agency. Caltrans' introduction in this comment is noted, and no further response is required.

Response to Comment F-3. Response to Comment F-3. The project Traffic Impact Analysis used 2009 Caltrans Annual Average Daily Traffic (AADT) volume data because it was the most current data available and was comparable to the 2007 AADT. In addition, 2007 counts for the intersection analysis were used because it was determined that the volumes in 2007 were significantly higher at some locations than in 2009 and would represent the worst-case scenario.

Response to Comment F-4. The project Traffic Impact Analysis used 2009 Caltrans data for K and D factors to be consistent with the 2009 Caltrans AADT volume data that was used in the analysis.

SUBJECT: VIP Moreno Valley
Notice of Availability (NOA) of a
Draft Environmental Impact Report

Dear Mr. Bradshaw:

Thank you for the opportunity to review the Notice of Availability (NOA) for the above referenced project. The project proposes to develop approximately 1,616,133 square feet of distribution warehouse space on an approximately 71 acre site. The single building will be constructed with 264 vertical-lift dock-high roll-up doors on the long (north and south) sides of the building to allow access for the loading and unloading of products from diesel truck/trailers. The project is estimated to be constructed by the year 2013. Eastern Municipal Water District (EMWD) offers the following comments. 1

The subject project requires water, sewer and recycled water services from EMWD. The details of said service connection points will be further detailed in a separate document, known as EMWD's Plan of Service, which is still not yet developed by the project proponent. To that end, EMWD requires dialog with the project proponent, to develop the EMWD Plan of Service, as clarified in the attached letter. 2

Again, EMWD appreciates the opportunity to comment on this project. Please forward the Final Environmental Impact Report to the attention of Helen Stratton at the mailing address shown on page one. If you have questions concerning these comments, please feel free to contact Helen Stratton at 951 928-3777, Ext. 4545, or Eli Rodriguez at Ext. 4450.

Sincerely,

Joseph B. Lewis
Director of Engineering Services

Re. NOP of DEIR, VIP Moreno Valley, TPM 36162

Attn. Jeff Bradshaw, Associate Planner, City Of Moreno Valley

In order to receive water, sewer or recycled water service(s) from Eastern Municipal Water District (EMWD), the following information will be helpful to the project proponent:

EMWD requires beginning dialogue with the project proponent at an early stage in site design and development, via a one-hour complimentary Due Diligence meeting. To set up this meeting, the project proponent should complete a Project Questionnaire (form NBD-058) and submit to EMWD. To download this form or for additional information, please visit our "New Development Process" web page, under the "Businesses" tab, at www.emwd.org. This meeting will offer the following benefits:

1. Describe EMWD's development work-flow process
2. Identify project scope and parameters
3. Preliminary, high level review of the project within the context of existing infrastructure
4. Discuss potential candidacy for recycled water service

Following the Due Diligence meeting, to proceed with this project, a Plan Of Service (POS) will need to be developed by the developer's engineer, and reviewed/approved by EMWD prior to submitting improvement plans for Plan Check. The POS process will provide the following:

1- Technical evaluation of the project's preliminary design
2- Defined facility requirements, i.e. approved POS
3- Exception: for feasibility evaluation of a purchase acquisition, only a conceptual facilities assessment may be developed.

2

If you have questions or concerns, please do not hesitate to contact me.

Sincerely,

Eli Rodriguez
New Business Development Department

2.16 RESPONSE TO LETTER G

Eastern Municipal Water District

Response to Comment G-1. The commentor has accurately summarized the general aspects of the proposed project.

Response to Comment G-2. Eastern Municipal Water District is providing information to the City and applicant that the applicant must submit a Plan of Services prior to construction of the project. The attachment letter outlines what is required of the applicant prior to construction. The comment does not directly refer to the Draft EIR but is provided for informational purposes.

To: Jeffrey Bradshaw
Cc: CLandry@wrcrca.org; Karin_Cleary-Rose@fws.gov
Subject: VIP Moreno Valley Draft Environmental Impact Report (DEIR) [FWS-WRIV-12B0233-12CPA0244]

Mr. Bradshaw,
The City of Moreno Valley submitted the above-mentioned DEIR to identify the proposed project's direct, indirect, and cumulative environmental impacts, to discuss alternatives, and to propose mitigation measures that avoid, minimize, or offset significant environmental impacts. The Service is providing the following comments as they relate to the project's consistency with the Western Riverside County Multiple Species Conservation Plan (MSHCP).

Focused surveys for special status plants and burrowing owls were conducted on the project site in 2009. We typically prefer that surveys for sensitive species are updated (i.e., no more than 1 year old) to demonstrate that the project is consistent with the MSHCP. However; given the disturbed condition of the project site (e.g., annual disking), we acknowledge that the focused surveys for sensitive plants and burrowing owls are sufficient. 1

We appreciate the inclusion of mitigation measures (Mitigation Measure BIO-1 through BIO-4) to avoid or minimize impacts to birds protected by the Migratory Bird Treaty Act (MBTA) and burrowing owls. Mitigation Measure BIO-3 specifies that if nesting special status avian species or burrowing owls occupy an area of disturbance, no construction activity will take place within 500 feet of an active nest/burrow until it has been determined that it is no longer active and all juveniles have fledged. In addition, we recommend that a biological monitor be present to monitor the effects of construction on any active nests and to ensure that there is no encroachment into the 500 foot nest buffer zones. 2

Thank you for the opportunity to review the DEIR. If you have any questions or comments please contact me at 760-322-2070 ext. 215.

Noelle Ronan
Fish and Wildlife Biologist
U.S. Fish and Wildlife Service
Palm Springs Fish and Wildlife Office
777 E. Tahquitz Canyon Way, Suite 208
Palm Springs, CA 92262
760-322-2070 ext. 215

2.18 RESPONSE TO LETTER H

United States Fish and Wildlife Service

Response to Comment H-1. The City concurs with the United States Fish and Wildlife Service's conclusion that the site is disturbed and that updated focused surveys for sensitive plants and the burrowing owl are not necessary even if the original surveys are now 3 years old.

Response to Comment H-2. The United States Fish and Wildlife Service concurs with the mitigation in the Draft EIR for the burrowing owl and recommends that a biological monitor be present during construction to monitor any active nests to ensure that there is no encroachment into the 500 foot nest buffer zone. The City concurs with this recommendation and mitigation Measure BIO-3 has been amended as follows:

> ***Mitigation Measure BIO-3:*** *If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.*

Attention: JEFF BRADSHAW

Ladies and Gentlemen:

Re: PM 36162 (PA 09-0012) + PP 09-0005

The District does not normally recommend conditions for land divisions or other land use cases in incorporated cities. The District also does not plan check city land use cases, or provide State Division of Real Estate letters or other flood hazard reports for such cases. District comments/recommendations for such cases are normally limited to items of specific interest to the District including District Master Drainage Plan facilities, other regional flood control and drainage facilities which could be considered a logical component or extension of a master plan system, and District Area Drainage Plan fees (development mitigation fees). In addition, information of a general nature is provided.

The District has not reviewed the proposed project in detail and the following checked comments do not in any way constitute or imply District approval or endorsement of the proposed project with respect to flood hazard, public health and safety or any other such issue:

_____ No comment.

_____ This project would not be impacted by District Master Drainage Plan facilities nor are other facilities of regional interest proposed.

_____ This project involves District Master Plan facilities. The District will accept ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.

_____ This project proposes channels, storm drains 36 inches or larger in diameter or other facilities that could be considered regional in nature and/or a logical extension of the adopted _____ Master Drainage Plan. The District would consider accepting ownership of such facilities on written request of the City. Facilities must be constructed to District standards, and District plan check and inspection will be required for District acceptance. Plan check, inspection and administrative fees will be required.

_____ This project is located within the limits of the District's _____ Area Drainage Plan for which drainage fees have been adopted; applicable fees should be paid by cashier's check or money order only to the Flood Control District or City prior to issuance of grading permits. Fees to be paid should be at the rate in effect at the time of issuance of the actual permit.

_____ An encroachment permit shall be obtained for any construction related activities occurring within District right of way or facilities. For further information, contact the District's encroachment permit section at 951.955.1266.

✓ The Districts previous comments are still valid. 1

GENERAL INFORMATION

This project may require a National Pollutant Discharge Elimination System (NPDES) permit from the State Water Resources Control Board. Clearance for grading, recordation or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.

If this project involves a Federal Emergency Management Agency (FEMA) mapped flood plain, then the City should require the applicant to provide all studies, calculations, plans and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation or other final approval of the project, and a Letter of Map Revision (LOMR) prior to occupancy.

If a natural watercourse or mapped flood plain is impacted by this project, the City should require the applicant to obtain a Section 1602 Agreement from the California Department of Fish and Game and a Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.

Very truly yours,

MEKBIB DEGAGA
Engineering Project Manager

This project may require a National Pollutant Discharge Elimination System (NPDES) permit from the State Water Resources Control Board. Clearance for grading, recordation or other final approval should not be given until the City has determined that the project has been granted a permit or is shown to be exempt.

If this project involves a Federal Emergency Management Agency (FEMA) mapped flood plain, then the City should require the applicant to provide all studies, calculations, plans and other information required to meet FEMA requirements, and should further require that the applicant obtain a Conditional Letter of Map Revision (CLOMR) prior to grading, recordation or other final approval of the project, and a Letter of Map Revision (LOMR) prior to occupancy.

If a natural watercourse or mapped flood plain is impacted by this project, the City should require the applicant to obtain a Section 1602 Agreement from the California Department of Fish and Game and a Clean Water Act Section 404 Permit from the U.S. Army Corps of Engineers, or written correspondence from these agencies indicating the project is exempt from these requirements. A Clean Water Act Section 401 Water Quality Certification may be required from the local California Regional Water Quality Control Board prior to issuance of the Corps 404 permit.

Very truly yours,

DALE V. ANDERSON
Engineering Project Manager

2.20 RESPONSE TO LETTER I

Riverside County Flood Control and Water Conservation District

Response to Comment I-1. The City acknowledged that the previous comments that were provided to the City during the NOP comment period are still valid and are provided in the second page of the response letter and included in Appendix A to the Draft EIR. The comments do not reflect the analysis in the Draft EIR and provide the City with facts that relate to the construction of the project and the project's responsibility to meet the Riverside County Flood Control and Water Conservation District's requirements.

Response to Comment I-2. The City acknowledges the project involves the District's Master Plan of Facilities. Refer to Response to Comment I-1.

Response to Comment I-3. The City acknowledges the project is located in the District's Perris Valley Area Drainage Plan and fees must be paid to the District by the project proponent prior to the issuance of grading permits. Refer to Response to Comment I-1.

Response to Comment I-4. The City acknowledges the project proponent is required to obtain an encroachment permit for any construction in the District's right of way or facilities. Refer to Response to Comment I-1.

STATE OF CALIFORNIA

GOVERNOR'S OFFICE *of* PLANNING AND RESEARCH

STATE CLEARINGHOUSE AND PLANNING UNIT

EDMUND G. BROWN JR.
GOVERNOR

KEN ALEX
DIRECTOR

June 5, 2012

RECEIVED
JUN 11 2012
CITY OF MORENO VALLEY
Planning Division

Jeff Bradshaw
City of Moreno Valley
14177 Frederick Street
Moreno Valley, CA 92552-0805

Subject: PA09-0004 (Plot Plan), PA09-0012 (Tentative Parcel Map No. 36162), and P11-020 (EIR)
SCH#: 2011081084

Dear Jeff Bradshaw:

The State Clearinghouse submitted the above named Draft EIR to selected state agencies for review. On the enclosed Document Details Report please note that the Clearinghouse has listed the state agencies that reviewed your document. The review period closed on June 4, 2012, and the comments from the responding agency (ies) is (are) enclosed. If this comment package is not in order, please notify the State Clearinghouse immediately. Please refer to the project's ten-digit State Clearinghouse number in future correspondence so that we may respond promptly.

Please note that Section 21104(c) of the California Public Resources Code states that:

> "A responsible or other public agency shall only make substantive comments regarding those activities involved in a project which are within an area of expertise of the agency or which are required to be carried out or approved by the agency. Those comments shall be supported by specific documentation."

These comments are forwarded for use in preparing your final environmental document. Should you need more information or clarification of the enclosed comments, we recommend that you contact the commenting agency directly.

This letter acknowledges that you have complied with the State Clearinghouse review requirements for draft environmental documents, pursuant to the California Environmental Quality Act. Please contact the State Clearinghouse at (916) 445-0613 if you have any questions regarding the environmental review process. J-1

Sincerely,

Scott Morgan
Director, State Clearinghouse

Project Title PA09-0004 (Plot Plan), PA09-0012 (Tentative Parcel Map No. 36162), and P11-020 (EIR)
Lead Agency Moreno Valley, City of

Type EIR Draft EIR

Description The project is generally described as a Plot Plan for development of a 1,616,133 s.f. warehouse distribution building on a 71.13 net acre site. The building includes 268 dock high doors and 44,000 s.f. of office area in four potential office locations. Tentative Parcel Map No. 36162 is proposed to combine four existing parcels into a single parcel for development of the 1.6 million square warehouse facility.

2.22 RESPONSE TO LETTER J

California Governor's Office of Planning and Research, State Clearinghouse

Response to Comment J-1. The City recognizes the receipt of comments from State agencies and the State Clearinghouse's acknowledgement that it has complied with review requirements for environmental documents.

3. EIR ERRATA

Any corrections to the Draft Environmental Impact Report (EIR) text and figures generated either from responses to comments or independently by the City, are stated in this section of the Final EIR. The Draft EIR text and figures have not been modified to reflect these EIR modifications.

These EIR errata are provided to clarify, refine, and provide supplemental information for the Starcrest Distribution Facility Project Draft EIR. Changes may be corrections or clarifications to the text and figures of the original Draft EIR. Other changes to the EIR clarify the analysis in the EIR based upon the information and concerns raised by commentors during the public review period. None of the information contained in these EIR modifications constitutes significant new information or changes to the analysis or conclusions of the Draft EIR.

The information included in this EIR erratum that resulted from the public comment process does not constitute substantial new information that requires recirculation of the Draft EIR. The California Environmental Quality Act (CEQA) Guidelines, Section 15088.5, states in part:

(a) A lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review under Section 15087 but before certification. As used in this section, the term "information" can include changes in the project or environmental setting as well as additional data or other information. New information added to an EIR is not "significant" unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement. "Significant new information" requiring recirculation includes, for example, a disclosure showing that:

(1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.

(2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.

(3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.

(4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(b) Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications in an adequate EIR.

The changes to the Draft EIR included in these EIR modifications do not constitute "significant" new information because:

No new significant environmental impact would result from the project or from a new mitigation measure;

There is no substantial increase in the severity of an environmental impact that would result unless mitigation measures are adopted that reduce the identified significant impacts to a level of insignificance;

MV00170284

No feasible project alternative or mitigation measure considerably different from others previously analyzed has been proposed or identified that would clearly lessen the significant environmental impacts of the project; and

The Draft EIR is not fundamentally or basically inadequate or conclusory in nature such that meaningful public review and comment were precluded.

Therefore, recirculation of the Draft EIR is not required because the new information added to the EIR through these modifications clarifies or amplifies information already provided or makes insignificant modifications to the already adequate Draft EIR.

For simplicity, the EIR modifications contained in the following pages are in the same order as the information appears in the Draft EIR. Changes in text are signified by strikeouts (~~strikeouts~~) where text has been removed and by double underlining (underline) where text has been added. The applicable page numbers from the Draft EIR are also provided where necessary for easy reference.

Draft EIR, Section 1.0 Executive Summary, Table 1.B: VIP Moreno Valley - Environmental Summary, pages 1-11 through 1-41

Table 1.B: VIP Moreno Valley - Environmental Summary in the Draft EIR has been updated to be consistent with changes that have been made, as a result of the responses to comments. Changes have been made to mitigation measures for air quality, biological resources, cultural resources, geology and soils, hydrology and water quality. These changes to the Draft EIR do not result in a significant impact and has no material effect on the findings of the Draft EIR.

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
AIR QUALITY		
Construction ~~Equipment Exhaust~~ Emissions: Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants? For construction operations, the applicable daily thresholds are: - 75 pounds per day of ROC; - 100 pounds per day of NO_X; - 550 pounds per day of CO; - 150 pounds per day of PM_{10}; - 150 pounds per day of SO_X; and - 55 pounds per day of $PM_{2.5}$.	**4.2.6.1B**. Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City. **4.2.6.1K** Grading plans, construction specifications and bid documents shall also include the following notations: • Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty; • Gravel pads shall be provided at all access	Significant and unavoidable

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	points to prevent tracking of mud onto public roads; • Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect; • The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site; • The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours; • High pressure injectors shall be provided on diesel construction equipment where feasible; • Engine size of construction equipment shall be limited to the minimum practical size; • Substitute gasoline-powered for diesel-powered construction equipment where feasible; • Use electric construction equipment where feasible; • Install catalytic converters on gasoline-powered equipment where feasible; • Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement; • Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	• Lunch vendor services shall be ~~provided~~ permitted onsite during construction to minimize the need for offsite vehicle trips; • All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered. • Suspend use of all construction equipment operations during second stage smog alerts. **4.2.6.1N**. When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained. **4.2.6.1O.** All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets. **4.2.6.1P.** Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil. **4.2.6.1Q**. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow. **4.2.6.1R** All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used. **4.2.6.1S** Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period;	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	and d) phasing of construction activities. **4.2.6.1T** Reroute construction trucks away from congested streets and sensitive receptor areas.	
Long-Term Operational Emissions: Would the proposed project violate any AAQS or contribute to an existing or projected air quality violation; or expose sensitive receptors to pollutants? For long-term operations, the applicable daily thresholds are: - 55 pounds of ROC; - 55 pounds of NOX; - 550 pounds of CO; - 150 pounds of PM10; - 55 pounds of PM2.5; and - 150 pounds of SOX.	**4.2.6.3A** Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any-combination of design features, including but not limited to the following list, may shall be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: • ~~Buildings shall e~~Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City. • Increase in insulation such that heat transfer and thermal bridging is minimized. • Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • ~~Interior~~Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards~~ shall be installed~~, as deemed acceptable by the City. ~~Automatic~~ Use automatic devices to turn off lights when they are not needed~~ shall be implemented~~. • To the extent that they are compatible with landscaping guidelines established by the City, use shade-producing trees, particularly those that shade paved	Significant and Unavoidable

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	surfaces such as streets and parking lots and buildings ~~shall be planted~~ at the project site. • ~~Paint~~ Use paint and a surface color palette for the project ~~shall~~ emphasizing light and off-white colors which reflect heat away from the buildings. • ~~All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.~~ • Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs. • ~~To r~~ Reduce energy demand associated with potable water conveyance~~, the project shall implement~~ using the following: ○ Landscaping palette emphasizing drought-tolerant plants; ○ Use of water-efficient irrigation techniques; and, ○ U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads. • ~~The project shall p~~ Provide secure, weather-protected, on-site bicycle storage/parking. • ~~The project shall p~~ Provide on-site showers (one for males and one for females). ~~L~~ Provide lockers for employees ~~shall be provided~~.	
	• ~~The project will e~~ Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	of project completion that outlines the measures implemented by the TMA, as well as contact information. • ~~The project shall p~~Provide preferential parking for carpools~~ and vanpool~~, vanpools or other alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools ~~shall be delineated~~ on the project site plan. • ~~The project shall p~~Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations ~~shall be indicated~~ on the project building plans. • Implement compressed workweek schedules. • Achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. • Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers. • Use of fleet vehicles conforming to 2010 air quality standards or better. • Installation of catalytic converters on gasoline-powered equipment. • Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets. • Establishment and use of carpool/vanpool programs, complemented by parking fees	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	for single-occupancy vehicles. • Provision of preferential parking for EV and CNG vehicles. • Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance. • Use of electric (instead of diesel or gasoline-powered) yard trucks. • Use of SmartWay 1.25 rated trucks. • Provide a display case or kiosk displaying transportation information including the RTA bus schedule in a prominent area accessible to employees. • Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes. ~~• Lease/purchase documents shall identify that tenants are encouraged to promote the following:~~ ~~○ Implementation of compressed workweek schedules.~~ ~~○ SmartWay partnership;~~ ~~○ Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long haul trips carried by SmartWay 1.0 or greater carriers.~~ ~~○ Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater~~

	~~carriers.~~ ~~○ Use of fleet vehicles conforming to 2010 air quality standards or better.~~ ~~○ Installation of catalytic converters on gasoline-powered equipment.~~ ~~○ Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.~~ ~~○ Establishment and use of carpool/vanpool programs, complemented by parking fees for single occupancy vehicles.~~ ~~○ Provision of preferential parking for EV and CNG vehicles.~~ ~~○ Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.~~ ~~○ Use of electric (instead of diesel or gasoline-powered) yard trucks.~~ ~~○ Use of SmartWay 1.25 rated trucks.~~	
BIOLOGICAL RESOURCES (FROM THE INITIAL STUDY [APPENDIX A])		
Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service? Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Conservation Community Plan, or other approved local, regional, or state habitat conservation plan?	**Mitigation Measure BIO-3:** If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.	Less Than Significant
CULTURAL RESOURCES (FROM THE INITIAL STUDY [APPENDIX A])		
Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	**Mitigation Measure CUL-1:** Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that	Less Than Significant

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	reach four feet or more below existing surface grade. ~~If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued.~~ In the event fossiliferous deposits are encountered, the following measures shall be implemented: • Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources. • Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored. • ~~If too few fossil remains are found after 50 percent of the planned for earthmoving has been completed, monitoring can be reduced or discontinued in those areas at the project paleontologist's direction.~~ • Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates. • Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	in hand prior to the initiation of mitigation activities. • Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources.	
GEOLOGY AND SOILS (FROM THE INITIAL STUDY [APPENDIX A])		
Be located on expansive soil, as defined in Table 18-a-B of the Uniform Building Code (1994), creating substantial risks to life or property?	**Mitigation Measure GEO-1:** Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure. The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site. The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the	Less Than Significant

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed. The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm. It should be noted that the above measure may be modified by the Final Geotechnical or Soils Report. **Mitigation Measure GEO-2:** Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be reviewed and considered implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties to determine in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans.	
GREENHOUSE GAS EMISSIONS AND CLIMATE CHANGE		
Would the proposed project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	**4.3.6.1A** Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that building features have been incorporated in building plans as required by Title 24 of the California Code of Regulations. These features include but are not limited to the	Less than Significant

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	following: • Exterior windows in the office areas shall utilize window treatments for efficient energy conservation. **4.3.6.1B** Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the design and construction of the project: • Use Encourage use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project. • Use Encourage use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project. • Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment where feasible. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants. • Design the project building to exceed the 2008 California Building Code's (CBC) Title 24 energy standard by 20%, including, but not limited to, any combination of the following: • Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment in the office areas. • Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. The landscaping plan shall be prepared by a registered landscape architect who will consider the following:	

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	○ Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements. ○ Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading. • Install electrical outlets on the exterior walls of the warehouse/office building (and perhaps parking lots) to promote the use of electric landscape maintenance equipment. **4.3.6.1C** Prior to the issuance of occupancy permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the operation of the project: • The project applicant shall use less than 3,900 low Global Warming Potential (GWP) hydrofluorocarbon (HCF) refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO2]) for refrigeration and fire suppression equipment. • Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows in the office areas.	
HYDROLOGY AND WATER QUALITY (FROM THE INITIAL STUDY [APPENDIX A])		
Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would result in substantial erosion or siltation on site or off site?	**Mitigation Measure HYD-05:** Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley, a Final Hydrologic and Hydraulic Analysis based on the City's existing drainage requirements. ~~submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and~~	Less Than Significant

Table 1.B: VIP Moreno Valley - Environmental Summary

Thresholds of Significance	Significance Impact & Mitigation Measures	Level of Significance after Mitigation
	~~report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed project site are less than or equal to pre-development flows.~~	

Draft EIR, Section 2.2.4 Technical Reports, Page 2-4.

There was a topographical error in this section of the Draft EIR indicating the incorrect date on the air quality and noise studies. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

2.2.4 Technical Reports

Various technical reports have been prepared to assess specific issues that may result from the construction and operation of the proposed project. As relevant, information from these technical reports has been incorporated into the Draft EIR. The technical reports and other information included as appendices to this EIR include the following:

Appendix A: *Initial Study, NOP, and NOP Comment Letters*, August 2011.

Appendix B: Initial Study Technical Reports

- Appendix B-1: *General Habitat Assessment, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California*, Ecological Sciences, Inc., August 1, 2010.
- Appendix B-2: *Jurisdictional Survey and MSHCP Riparian/Riverine/Vernal Pools Evaluation, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California*, Ecological Sciences, Inc., November 1, 2009.
- Appendix B-3: *Focused Surveys for Selected Criteria Area and Narrow Endemic Plant Species, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California*, Ecological Sciences, Inc., November 9, 2009.
- Appendix B-4: *Focused Western Burrowing Owl Survey, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California*, Ecological Sciences, Inc., November 11, 2009.
    - Appendix B-5: *Phase I Cultural Resources Assessment and Paleontological Records Review Perris Boulevard Project, Moreno Valley, Riverside County, California,* Michael Brandman Associates, March 22, 2007.
    - Appendix B-6: *Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California*, NorCal Engineering, March 7, 2007.
    - Appendix B-7: *Phase I Environmental for the Evaluation of Potentially Hazardous Materials*, Centec Engineering, February 23, 2007.

MV00170298

- Appendix B-8: *Preliminary Hydrology Report and Hydraulic Analysis for PA09-004, VIP Moreno Valley, SWC Perris Boulevard and Grove View Road*, Robert A. Bebensee, R.C.E., March 27, 2009.
- Appendix B-9: *Preliminary Water Quality Management Plan, for PA09-0004 VIP Moreno Valley, SWC Perris Boulevard and Grove View Road*, Robert A. Bebensee, R.C.E., July 24, 2009.
- Appendix B-10: *Water Supply Assessment for City of Moreno Valley Plot Plan Application PA09-004*, Eastern Municipal Water District, January 20, 2010.

Appendix C: *LESA Modeling Worksheets*, LSA Associates, Inc., August 2011.

Appendix D-1: *Air Quality Analysis VIP Moreno Valley*, LSA Associates, Inc., ~~August 2011~~ March 2012

Appendix D-2: *Health Risk Assessment VIP Moreno Valley*, LSA Associates, Inc., ~~August 2011~~ March 2012.

Appendix E: *Greenhouse Gas Emissions and Global Climate Change Study*, LSA Associates, Inc., ~~August 2011~~ December 2011.

Appendix F: *Noise Impact Analysis VIP Moreno Valley*, LSA Associates, Inc., ~~August 2011~~ March 2012.

Appendix G: *Traffic Study VIP Moreno Valley*, LSA Associates, Inc., ~~January~~ April 9, 2012.

Draft EIR, Section 2.5.2 Biological Resources, Page. 2-9.

The last sentence in paragraph 3 has been deleted because jurisdictional delineation was prepared for the proposed project (Jurisdictional Survey and MSHCP Riparian/Riverine/Vernal Pools Evaluation, 71± Site (APNs: 316-210-071, -073, -075, -076), Moreno Valley, Riverside County California, Ecological Sciences, Inc., November 1, 2009). Therefore the sentence was deleted because it was an error. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

Thirty-one species in western Riverside County have special status under the Federal Endangered Species Act (FESA) and/or the California Endangered Species Act (CESA). These include species that are listed as “endangered” or “threatened” under the FESA or that have been “proposed” or are “candidates” for such listing. These also include species that are listed as “endangered,” “threatened,” or “rare” under the CESA or that have been petitioned (i.e., are “candidates”) for listing. The Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) provides for the long-term survival of protected and sensitive species by designating a contiguous system of habitat to be added to existing public/quasi-public lands. The Plan includes an impact fee collected by the 16 member cities and other local agencies, including the City of Moreno Valley, used to acquire these lands. Depending on the location of a private or public development project, certain biological studies may be required to comply with the MSHCP. The MSHCP defines two distinct consistency processes for development projects based on their location within the MSHCP Plan Area, with separate processes for projects located outside of Criteria Areas and those within a Criteria Area. Through implementation of these requirements, development projects are found to be consistent with the MSHCP, and impacts to covered species are considered less than significant. The project site is not located within an MSHCP Criteria Area, but is located in an area requiring habitat assessments for burrowing owl (Athene cunicularia), five Narrow Endemic Plant Species (NEPS), and nine Criteria

Area Plant Species (CAPS). ~~A Jurisdictional Delineation is required to assess potential jurisdiction of the ditch running north/south through the center of the project site.~~

Draft EIR, Section 2.5.2 Biological Resources, Page. 2-10.

Consistent with the comments provided by Letter H (Fish and Wildlife Service), the text in Draft EIR of Mitigation Measure BIO-3 is amended. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR

Mitigation Measure BIO-3: If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.

Draft EIR, Section 2.5.3 Cultural Resources, Page 2-13.

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text in Draft EIR of Mitigation Measure CUL-1 is amended. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

Mitigation Measure CUL-1: Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. ~~If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued.~~ In the event fossiliferous deposits are encountered, the following measures shall be implemented:

- Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources.
- Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored.
- ~~If too few fossil remains are found after 50 percent of the planned-for earthmoving has been completed, monitoring can be reduced or discontinued in those areas at the project paleontologist's direction.~~
- Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates.
- Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written repository agreement in hand prior to the initiation of mitigation activities.

- Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources.

Draft EIR, Section 2.4.4 Geology and Soils, Page 2-16.

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text in Draft EIR of Mitigation Measure GEO-2 is amended for clarification purposes. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

Mitigation Measure GEO-1: Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and avoid differential settlement of the structure.

The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site.

The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed.

The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm.

It should be noted that the above measure may be modified by the Final Geotechnical or Soils Report.

Mitigation Measure GEO-2: Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be ~~reviewed and considered~~ implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties ~~to determine~~ in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans.

Draft EIR, Section 2.5.6 Hydrology and Water Quality Hydrology, Page. 2-24.

Mitigation Measure HYD-05 has been revised to clarify the finalization of the Hydrologic and Hydraulic Analysis. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

To reduce the flows to below or equal to pre-development conditions, the anticipated on-site flows would be routed to the water quality features such as vegetated swales, clarifiers, and sand filters to reduce flows leaving the site to pre-development flow rates. While the increase in impervious surfaces attributable to the proposed project would contribute to a greater volume and higher velocity of storm water flows, the proposed project's drainage system would accept and accommodate runoff that would result from project construction at or below pre-project conditions. Therefore, the post-development flows generated on the project site would not exceed the capacity of the planned storm water drainage systems. Although adherence to the City's drainage requirements, which includes the preparation of drainage sizing calculations, is required of all applicable development within the City, the incorporation of this requirement as **Mitigation Measure HYD-05** is designed to track both standard requirements and mitigation measures as part of the project's MMRP. ~~To ensure that long-term drainage capacity issues are reduced to a less than significant level, **Mitigation Measure HYD-05** has been identified.~~ With adherence to this mitigation measure, impacts associated with this issue are less than significant.

Mitigation Measure HYD-05: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley, a Final Hydrologic and Hydraulic Analysis based on the City's existing drainage requirements. ~~submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed project site are less than or equal to pre-development flows.~~

Draft EIR, Section 2.7 Cumulative Projects, Table 2.C, Page 34

There was a topographical error in Table 2.C of the Draft EIR indicating the incorrect map number. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

Draft EIR Section 4.2 Air Quality, Page 4.2-1

There was a topographical error in this section of the Draft EIR indicating the incorrect date on the air quality, health risk assessment and traffic studies. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.2 AIR QUALITY

This section analyzes the proposed project's potential air quality impacts based on the comprehensive *Air Quality Analysis* contained in Appendix D-1 (LSA Associates, Inc. ~~December 2011~~ March 2012) and the *Health Risk Assessment* (LSA Associates, Inc. ~~December 2011~~ March 2012) contained in Appendix D-2 to this EIR. The air quality analysis evaluates potential air quality impacts and mitigation measures by examining the short-term construction and long-term operational impacts associated with the project and by evaluating the effectiveness of mitigation measures incorporated as part of the project design. Additionally, the analysis provides a discussion of the proposed project, the physical setting of the project area, and the air quality regulatory framework. Modeled air quality levels are based upon vehicle data and project trip generation included in the project's Traffic Study (LSA Associates, Inc. ~~November 2011~~ January 2012, Appendix G of EIR) and peak turn volumes generated for the proposed project combined with emission factors from the California Air Resources Board (ARB). The evaluation was prepared in accordance with appropriate standards, utilizing procedures and methodologies in the South Coast Air Quality Management District (SCAQMD) *CEQA Air Quality Handbook* (SCAQMD 1993). Air quality data posted by the ARB and the U.S. Environmental Protection Agency (EPA) Web sites are included to document the local air quality environment.

Draft EIR Section 4.2.5.5, Operational-Acute Health Risk Impacts Page 4.2-18

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text in Draft EIR Section 4.2.5.5, Page 4.2-18 is amended to refer the reader back to the previous section (4.2.5.4) to further substantiate the conclusions identified in Section 4.2.5.5. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.5.5 Operational-Acute Health Risk Impacts

Threshold	Would the proposed project expose sensitive receptors to substantial pollutant concentrations?

Exposure to diesel exhaust can have immediate health effects, such as irritation of the eyes, nose, throat, and lungs, and it can cause coughs, headaches, light headedness, and nausea. In studies with human volunteers, diesel exhaust particles made people with allergies more susceptible to the materials to which they are allergic, such as dust and pollen. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks. However, according to the rulemaking on *Identifying Particulate Emissions from Diesel-Fueled Engines as a Toxic Air Contaminant* (ARB 1998), the available data from studies of humans exposed to diesel exhaust are not sufficient for deriving an acute non-cancer health risk guidance value. While the lung is a major target organ for diesel exhaust, studies of the gross respiratory effects of diesel exhaust in exposed workers have not provided sufficient exposure information to establish a short-term non-cancer health risk guidance value for respiratory effects. As previously identified in Section 4.2.5.4, none of the criteria pollutant emissions would exceed localized thresholds during the operation of the proposed project. Therefore, the proposed project would not have a significant impact on localized operational pollutant levels and no mitigation measures would be required. Similarly ~~Therefore,~~ the potential for short-term acute exposure from diesel exhaust are considered to be less than significant and no mitigation is required.

Draft EIR Section 4.2.6.1 Construction Emissions, Page 4.2-19

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text at Draft EIR Section 4.2.6.1, Page 4.2-19 is amended to clarify that the proceeding analysis evaluates all construction emissions. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.6.1 Construction ~~Equipment Exhaust~~ Emissions

Draft EIR Section 4.2.6.1 Construction Emissions, Table 4.2.I, Page 4.2-20.

Consistent with the comments provided by Letter D (Johnson & Sedlack), the data in Table 4.2.I in Draft EIR Section 4.2.6.1, Page 4.2-20 is amended to correct typographical errors in the Draft EIR. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

Source: LSA Associates, Inc., December 2011.

Draft EIR Section 4.2.6.1, Construction Emissions Page 4.2-21.

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text at Mitigation Measure 4.2.6.1B in Draft EIR Section 4.2.6.1, Page 4.2-21 is amended to clarify that clean-fuel means fuel other than diesel or gasoline. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.6.1B. Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.

Draft EIR Section 4.2.6.1, Construction Emissions Page 4.2-23.

Consistent with the comments provided by Letter D (Johnson & Sedlack), the Mitigation Measures have been added to Draft EIR Section 4.2.6.1, Page 4.2-23 to further reduce construction air quality impacts. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.6.1K Grading plans, construction specifications and bid documents shall also include the following notations:

- Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty;
- Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads;
- Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect;
- The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site;
- The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours;
- High pressure injectors shall be provided on diesel construction equipment where feasible;
- Engine size of construction equipment shall be limited to the minimum practical size;
- Substitute gasoline-powered for diesel-powered construction equipment where feasible;
- Use electric construction equipment where feasible;
- Install catalytic converters on gasoline-powered equipment where feasible;
- Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement;

- Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs;

- Lunch vendor services shall be ~~provided~~ permitted onsite during construction to minimize the need for offsite vehicle trips;

- All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.

- Suspend use of all construction equipment operations during second stage smog alerts.

4.2.6.1N. When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.

4.2.6.1O. All streets shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers utilizing reclaimed water trucks if visible soil materials are carried to adjacent streets.

4.2.6.1P. Any vegetative cover to be utilized onsite shall be planted as soon as possible to reduce the disturbed area subject to wind erosion. Irrigation systems required for these plants shall be installed as soon as possible to maintain good ground cover and to minimize wind erosion of the soil.

4.2.6.1Q. Provide temporary traffic controls such as a flag person, during all phases of construction to maintain smooth traffic flow.

4.2.6.1R All roadways, driveways, sidewalks, etc., should be completed as soon as possible. In addition, building pads should be laid as soon as possible after grading unless seeding or soil binders are used.

4.2.6.1S Implement activity management techniques including a) development of a comprehensive construction management plan designed to minimize the number of large construction equipment operating during any given time period; b) scheduling of construction truck trips during non-peak hours to reduce peak hour emissions; c) limitation of the length of construction work-day period; and d) phasing of construction activities.

4.2.6.1T Reroute construction trucks away from congested streets and sensitive receptor areas.

Draft EIR Section 4.2.6.3 Long Term Operation Omissions, Page 4.2-25

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text in Impact 4.2.6.1 in Draft EIR Section 4.2.6.3, Page 4.2-25 is amended to clarify the impact statement. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

> **Impact 4.2.6.3:** *Implementation of the proposed project may ~~occur~~ have the potential to exceed applicable daily thresholds for operational activities.*

Draft EIR Section 4.2.6.3 Long Term Operation Omissions, Page 4.2-27

Consistent with the comments provided by Letter D (Johnson & Sedlack), the Mitigation Measures have been amended and added to Draft EIR Section 4.2.6.3, Page 4.2-27 to further reduce construction air quality impacts. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.6.3A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent:

- ~~Buildings shall e~~ Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City.
- Increase in insulation such that heat transfer and thermal bridging is minimized.
- Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption.
- Incorporate dual-paned or other energy efficient windows.
- Incorporate energy efficient space heating and cooling equipment.
- ~~Interior~~ Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards ~~shall be installed~~, as deemed acceptable by the City. ~~Automatic~~ Use automatic devices to turn off lights when they are not needed ~~shall be implemented~~.
- To the extent that they are compatible with landscaping guidelines established by the City, use shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings ~~shall be planted~~ at the project site.
- ~~Paint~~ Use paint and a surface color palette for the project ~~shall~~ emphasizing~~e~~ light and off-white colors which reflect heat away from the buildings.
- ~~All buildings shall be designed to accommodate renewable energy sources, such as photovoltaic solar electricity systems, appropriate to their architectural design.~~
- Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs.
- ~~To r~~Reduce energy demand associated with potable water conveyance~~, the project shall implement~~ using the following:
  - Landscaping palette emphasizing drought-tolerant plants;
  - Use of water-efficient irrigation techniques; and,
  - U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads.
- ~~The project shall p~~ Provide secure, weather-protected, on-site bicycle storage/parking.
- ~~The project shall p~~ Provide on-site showers (one for males and one for females). ~~L~~Provide lockers for employees ~~shall be provided~~.

- ~~The project will e~~ Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information.
- ~~The project shall p~~ Provide preferential parking for carpools ~~and vanpool~~, vanpools or other alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools ~~shall be delineated~~ on the project site plan.
- ~~The project shall p~~ Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations ~~shall be indicated~~ on the project building plans.
- Implement compressed workweek schedules;
- Achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers.
- Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers.
- Use of fleet vehicles conforming to 2010 air quality standards or better.
- Installation of catalytic converters on gasoline-powered equipment.
- Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets;
- Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles;
- Provision of preferential parking for EV and CNG vehicles;
- Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance;
- Use of electric (instead of diesel or gasoline-powered) yard trucks;
- Use of SmartWay 1.25 rated trucks.
- Provide a display case or kiosk displaying transportation information including the RTA bus schedule in a prominent area accessible to employees.
- Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no more than three years prior to date of use or any combination of these two themes.
- ~~Lease/purchase documents shall identify that tenants are encouraged to promote the following:~~
    - ~~Implementation of compressed workweek schedules.~~
    - ~~SmartWay partnership;~~

- ~~Achievement of at least 20 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90 percent of all long haul trips carried by SmartWay 1.0 or greater carriers.~~
- ~~Achievement of at least 15 percent per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85 percent of all consolidator trips carried by SmartWay 1.0 or greater carriers.~~
- ~~Use of fleet vehicles conforming to 2010 air quality standards or better.~~
- ~~Installation of catalytic converters on gasoline-powered equipment.~~
- ~~Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets.~~
- ~~Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles.~~
- ~~Provision of preferential parking for EV and CNG vehicles.~~
- ~~Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance.~~
- ~~Use of electric (instead of diesel or gasoline-powered) yard trucks.~~
- ~~Use of SmartWay 1.25 rated trucks.~~

Draft EIR, Section 4.2.7.1 Short-Term Air Quality Impacts, Page 4.2-25

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text in Draft EIR Section 4.2.7.1, Page 4.2-25 is amended to clarify that the short-term and long-term air quality impacts are cumulative. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.2.7.1 Short-Term Air Quality Impacts

The cumulative area for air quality impacts is the Basin. The implementation of the project would contribute criteria pollutants to the area during project construction. A number of individual projects in the area may be under construction simultaneously with the proposed project. Depending on construction schedules and actual implementation of projects in the area, generation of fugitive dust and pollutant emissions during construction would result in substantial short-term increases in air pollutants. However, each project would be required to comply with the SCAQMD's standard construction measures. In addition, implementation of the AQMP will result in improved air quality levels in the future and full attainment of national and state ambient air quality standards, resulting in less than significant cumulative impacts from all short-term and long-term air pollution sources. Therefore, cumulative impacts associated with short-term air quality impacts would be less than significant.

Draft EIR Section 4.3.6.1 Greenhouse Gas Emissions and Climate Change, Page 4.3-24 and 25

The Mitigation Measures in the Draft EIR Section 4.3.6.1, Page 4.3-24 and 25 have been clarified. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.3.6.1A Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that building features have been incorporated in building plans as required by Title 24 of the California Code of Regulations. These features include but are not limited to the following:

- Exterior windows in the office areas shall utilize window treatments for efficient energy conservation.

Draft EIR Section 4.3.6.1 Greenhouse Gas Emissions and Climate Change, Page 4.3-25

Consistent with the comments provided by Letter D (Johnson & Sedlack), the Mitigation Measures have been added to Draft EIR Section 4.3.6.1, Page 4.2-25 to further reduce greenhouse gas emissions. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.3.6.1B Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the design and construction of the project:

- ~~Use~~ Encourage use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project.
- ~~Use~~ Encourage use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project.
- Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment where feasible. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants.
- Design the project building to exceed the 2008 California Building Code's (CBC) Title 24 energy standard by 20%, including, but not limited to, any combination of the following:
- Incorporate ENERGY STAR or better rated windows, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment in the office areas.
- Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. The landscaping plan shall be prepared by a registered landscape architect who will consider the following:
    - Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements.

- Plant Low-OFP, native, drought-resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading.

- Install electrical outlets on the exterior walls of the warehouse/office building (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.

Draft EIR, Section 4.3.6.1 Greenhouse Gas Emissions and Climate Change, Page 4.3-26, Mitigation Measure 4.3.6.1C

Consistent with the comments provided by Letter D (Johnson & Sedlack), the text for the conclusion of Impact 4.3.6.1 in Draft EIR Section 4.2.6.3, Page 4.3-16 is amended to clarify the impact statement. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

4.3.6.1C Prior to the issuance of occupancy permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the operation of the project:

- The project applicant shall use ~~less than 3,900~~ low Global Warming ~~Potential (GWP) hydrofluorocarbon (HCF)~~ refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO2]) for refrigeration and fire suppression equipment.

- Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows in the office areas.

Level of Significance After Mitigation. The mitigation measures identified above would contribute to a reduction in GHG emissions from energy, mobile, and water usage sources. With implementation of the identified mitigation measures, the proposed project's GHG emissions are reduced. As described above, project-related GHG emissions are not confined to a particular air basin but are dispersed worldwide. Consequently, it is speculative to determine how project-related GHG emissions would contribute to global climate change and how global climate change may impact the State. Therefore, project-related GHG emissions are not project-specific impacts to global warming but are instead the project's contribution to this cumulative impact. As stated previously, project-related GHG emissions and their contribution to global climate change impacts in the State are less than significant ~~and less than cumulatively considerable~~ on a project specific basis because: (1) the project's impacts alone would not cause or significantly contribute to global climate change, and (2) the project has no substantial effect on consumption of fuels or other energy resources, especially fossil fuels that contribute to GHG emissions when consumed. However, project-related GHG emissions and their contribution to global climate change impacts are considered to be cumulatively considerable.

Draft EIR Section 4.4 Noise, Page 4.4-1

There was a topographical error in this section of the Draft EIR indicating the incorrect date on the noise study. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the Draft EIR.

4.4 NOISE

This analysis is intended to satisfy the City's requirements for a project-specific noise impact analysis by examining the short-term and long-term noise impacts of the proposed project on sensitive uses adjacent to the proposed project site and by evaluating the effectiveness of mitigation measures incorporated as part of the project design. This includes the potential for the proposed project to result in impacts associated with a substantial temporary and/or permanent increase in ambient noise levels in the vicinity of the project area; exposure of people to excessive noise levels, groundborne vibration, or groundborne noise levels. The analysis contained in this section is based on a comprehensive *Noise Impact Analysis* contained in Appendix E (LSA Associates, Inc., ~~December 2011~~ March 2012), which examines existing ambient noise conditions and project-related impacts.

Draft EIR, Section 5.4 Consistency With Local And Regional Plans, Page 5-12

A new table (Table 5.D: Compass Growth Vision Report Consistency) has been added as a response to a comment received on the Draft EIR. This change to the Draft EIR does not result in a significant impact and has no material effect on the findings of the EIR.

Compass Growth Vision. The Compass Growth Vision plan provides a framework for local and regional decision-making regarding growth, transportation, land use, and economic development. The framework includes principles and a specific set of strategies intended to achieve and improve a quality of life that promotes and sustains for future generations the region's mobility, livability, and prosperity. The main objective of the Compass Growth Vision is to manage the forecast growth while improving future living conditions for all people within the SCAG area, including live, work, and play activities. The following discussion includes the principles within the Compass Growth Vision plan and their association to the proposed project.

Principle 1: Improve mobility for all residents.

Principle 2: Foster livability in all communities.

Principle 3: Enable prosperity for all people.

Principle 4: Promote sustainability for future generations.

The proposed project is consistent with the four principles identified above (refer to Table 5.D). ~~The nature of the proposed project allows the transport of commodities from a single area rather than multiple areas, minimizing vehicle trip generation. The proposed project supports the prosperity for all people by providing employment opportunities close to existing housing within the City of Moreno Valley. The proposed project is located in an area that is already developed with urban uses and where existing infrastructure (freeway, sewer, electrical, water, etc.) is accessible. During the construction of the project and as needed throughout the process, necessary utility and roadway improvements will be installed or extended to the project site from adjacent existing facilities. The utility and roadway improvements will facilitate future growth in the surrounding area. The development of the proposed project is consistent with the land use vision for the site and will augment existing services available in the City and region.~~

Table 5.D: Compass Growth Vision Report Consistency

Policy	Consistency Analysis
Principle 1: Improve mobility for all residents. • Encourage transportation investments and land use decisions that are mutually supportive. • Locate new housing near existing jobs and new jobs near existing housing. • Promote a variety of travel choices.	The project is consistent with this principle. The actions associated with implementation of the proposed project would allow for warehousing uses to be clustered around other industrial and commercial uses and would encourage a reduction of vehicle miles traveled within the City. Implementation of the project would create approximately 646 jobs. Existing housing is located approximately 1 mile to the north and 2 miles to the south of the project site. The project is consistent with this portion of Principle 1. There are a number of transit-oriented strategies that could be implemented by the proposed project to encourage alternate modes of travel, including informational strategies, incentives, and services. (Refer to Mitigation Measure 4.2.6.3A).
Principle 2: Foster livability in all communities. • Promote developments which provide a mix of uses. • Promote "people scaled, "walkable communities. • Support the preservation of stable, single-family neighborhoods.	The project is consistent with the applicable portions of this principle. The proposed project is a warehousing project and does not include any residential uses. Therefore, the project is not considered to be a mixed use project and this portion of Principle 2 is not applicable to the project. The project site is located in an industrial warehouse area. The project would include sidewalks so that the opportunity of being walkable within this warehouse area is possible. Therefore, the project is consistent with this portion of Principle 2. The proposed project is a warehousing project and does not include any residential uses. Therefore this portion of Principle 2 is not applicable to the project.
Principle 3: Enable prosperity for all people. • Provide in each community a variety of housing types to meet the housing needs of all income levels. • Support educational opportunities that promote balanced growth. • Ensure environmental justice regardless of race, ethnicity, or income class. • Support local and state fiscal policies that	Based on the information provided below, this principle is not applicable to the project. The proposed project is a warehousing project and does not include any residential or educational uses. Therefore this portion of Principle 3 is not applicable to the project. The project site is vacant and the project located in an area identified for industrial and commercial uses. Therefore, this issue not applicable to the project. The supporting of local and state fiscal policies and the encouragement of civic engagement is at the City level not the

Table 5.D: Compass Growth Vision Report Consistency

Policy	Consistency Analysis
encourage balanced growth. • Encourage civic engagement.	project level. Therefore, this portion of the principle is not applicable to the project.
Principle 4: Promote sustainability for future generations. • Focus development in urban centers and existing cities. • Develop strategies to accommodate growth that uses resources efficiently, eliminate pollution and significantly reduce waste. • Utilize "green" development techniques.	The project is consistent with this principle. The proposed project is located in an area that is already developed with urban uses and where existing infrastructure (freeway, sewer, electrical, water, etc.) is accessible. Mitigation Measure 4.3.1.6B requires the project to implement various sustainability strategies and "green" development techniques that uses resources efficiently, eliminates pollution, and reduces waste.

4. MITIGATION MONITORING AND REPORTING PROGRAM

4.1 INTRODUCTION

This Mitigation Monitoring and Reporting Program has been prepared for use in implementing mitigation for the:

VIP Moreno Valley Project

The program has been prepared in compliance with State law and the Environmental Impact Report (EIR) (State Clearinghouse No. 2011081084) prepared for the project by the City of Moreno Valley.

The California Environmental Quality Act (CEQA) requires adoption of a reporting or monitoring program for those measures placed on a project to mitigate or avoid adverse effects on the environment (Public Resource Code Section 21081.6). The law states that the reporting or monitoring program shall be designed to ensure compliance during project implementation.

The monitoring program contains the following elements:

1) The mitigation measures are recorded with the action and procedure necessary to ensure compliance. In some instances, one action may be used to verify implementation of several mitigation measures.
2) A procedure for compliance and verification has been outlined for each action necessary. This procedure designates who will take action, what action will be taken and when, and to whom and when compliance will be reported.
3) The program has been designed to be flexible. As monitoring progresses, changes to compliance procedures may be necessary based upon recommendations by those responsible for the program. As changes are made, new monitoring compliance procedures and records will be developed and incorporated into the program.

This Mitigation Monitoring and Reporting Program includes mitigation identified in the Initial Study and the Final EIR.

4.2 MITIGATION MONITORING AND RESPONSIBILITIES

As the Lead Agency, the City of Moreno Valley is responsible for ensuring full compliance with the mitigation measures adopted for the proposed project. The City will monitor and report on all mitigation activities. Mitigation measures will be implemented at different stages of development throughout the project area. In this regard, the responsibilities for implementation have been assigned to the Applicant, Contractor, or a combination thereof. If during the course of project implementation, any of the mitigation measures identified herein cannot be successfully implemented, the City shall be immediately informed, and the City will then inform any affected responsible agencies. The City, in conjunction with any affected responsible agencies, will then determine if modification to the project is required and/or whether alternative mitigation is appropriate.

MV00170315

4.3 MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST

Project File Name: VIP Moreno Valley Project **Applicant:** Vogel Engineers, Inc.
Date: June 2012

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
AIR QUALITY						
4.2.6.1A Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall place construction equipment staging areas at least 200 feet away from sensitive receptors. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading and during grading operations.	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.1B Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize power sources (e.g., power poles) or clean-fuel (e.g., fuel other than diesel or gasoline) generators where feasible. Contract specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit or Issuance of a Stop Work Order
4.2.6.1C Prior to the issuance of a grading permit, the project developer shall require by contract specifications that contractors shall utilize California Air Resources Board (CARB) Tier II Certified equipment or better during the rough/mass grading phase for the following pieces of equipment: rubber-tired dozers and scrapers. Contract	City of Moreno Valley Engineering and Building and Safety Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
specifications shall be included in the proposed project construction documents, which shall be reviewed by the City.						
4.2.6.1D All clearing, grading, earthmoving, or excavation activities shall cease when winds exceed 25 mph per SCAQMD guidelines in order to limit fugitive dust emissions.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During grading	Review of construction documents and on-site inspection		Issuance of a Stop Work Order
4.2.6.1E The contractor shall ensure that all disturbed unpaved roads and disturbed areas within the project are watered at least three times daily during dry weather. Watering, with complete coverage of disturbed areas, shall occur at least three times a day, preferably in the mid-morning, afternoon, and after work is done for the day.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1F The contractor shall ensure that traffic speeds on unpaved roads and project site areas are reduced to 15 miles per hour or less to reduce PM10 and PM2.5 fugitive dust haul road emissions. Speed limit signs (15 mph maximum) shall be posted at entry points to the project site, and along any unpaved roads providing access to or within the project site and/or any unpaved designated on-site travel routes.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1G Groundcover shall be replaced, and/or non-toxic soil stabilizers shall be applied (according to manufacturers' specifications) to any inactive	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
construction areas (previously graded areas inactive for ten days or more).	Planning Division					
4.2.6.1H The contractor shall minimize pollutant emissions by maintaining equipment engines in good condition and in proper tune according to manufacturer's specifications and during smog season (May through October) by not allowing construction equipment to be left idling for more than five minutes (per California law).	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1I The contractor shall ensure use of low-sulfur diesel fuel in construction equipment as required by the California Air Resources Board (CARB) (diesel fuel with sulfur content of 15 ppm by weight or less).	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1J If available, the project applicant shall use "Low-Volatile Organic Compounds" paints, coatings, and solvents with a VOC content lower than required under Rule 1113 (not to exceed 150 grams/liter; 1.25 pounds/gallon). High Pressure Low Volume (HPLV) applications of paints, coatings, and solvents shall be consistent with South Coast Air Quality Management District Rule 1113. Alternatively, the project applicant shall use materials that do not require painting or are pre-painted.	City of Moreno Valley Engineering and Building and Safety Planning Division	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1K Grading plans, construction specifications and bid documents shall	City of Moreno Valley Engineering	Prior to Grading and during	Prior to Issuance of Grading Permit	Review of construction		Withhold Grading Permit

MV00170318

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
also include the following notations: • Off-road construction equipment shall utilize alternative fuels where feasible e.g., biodiesel fuel (a minimum of B20), natural gas (CNG), liquefied natural gas (LNG), propane, except for equipment where use of such fuels would void the equipment warranty; • Gravel pads shall be provided at all access points to prevent tracking of mud onto public roads; • Install and maintain trackout control devices at all access points where paved and unpaved access or travel routes intersect; • The contractor or builder shall designate a person or person(s) to monitor the dust control program and to order increased watering, as necessary, to prevent transport of dust off site; • The contractor or builder shall post a publicly visible sign with the telephone number and person to contact regarding dust complaints. The contact person shall take corrective action within 24 hours; • High pressure injectors shall be provided on diesel construction equipment where feasible; • Engine size of construction	and Building and Safety Planning Division	grading operations.		documents and on-site inspection		or Issuance of a Stop Work Order

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
equipment shall be limited to the minimum practical size; • Substitute gasoline-powered for diesel-powered construction equipment where feasible; • Use electric construction equipment where feasible; • Install catalytic converters on gasoline-powered equipment where feasible; • Ride-sharing program for the construction crew shall be encouraged and shall be supported by contractor(s) via incentives or other inducement; • Documentation shall be provided to the City of Moreno Valley indicating that construction workers have been encouraged to carpool or otherwise reduce VMT to the greatest extent practical, including providing information on available park and ride programs; • Lunch vendor services shall be permitted onsite during construction to minimize the need for offsite vehicle trips; • All forklifts used during construction and in subsequent operation of the project shall be electric or natural gas powered.						

MV00170320

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Suspend use of all construction equipment operations during second stage smog alerts.						
4.2.6.1L Throughout project construction, a construction relations officer/community liaison, appointed by the Applicant, shall be retained on-site. In coordination and cooperation with the City, the construction relations officer/community liaison shall respond to any concerns related to PM10 (fugitive dust) generation or other construction-related air quality issues.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1M All project entrances shall be posted with signs which state: • Truck drivers shall turn off engines when not in use; • Diesel delivery trucks servicing the project shall not idle for more than three (3) minutes; and • Telephone numbers of the building facilities manager and CARB, to report violations.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1N When materials are transported off-site, all material shall be covered, effectively wetted to limit visible dust emissions, and at least six inches of freeboard space from the top of the container shall be maintained.	City of Moreno Valley Engineering and Building and Safety	Throughout construction	During Construction	On-site inspection		Issuance of a Stop Work Order
4.2.6.1O All streets shall be swept at least	City of Moreno	Throughout	During	On-site inspection		Issuance of a

4.2.6.3A Prior to issuance of the first building permit, building and site plan designs shall ensure that the project's energy efficiencies surpass applicable 2008 California Title 24, Part 6 Energy Efficiency Standards by a minimum of 20 percent. Verification of increased energy efficiencies shall be documented in Title 24 Compliance Reports provided by the Applicant, and reviewed and approved by the City. Any combination of design features, including but not limited to the following list, may be used to fulfill this requirement provided that the total increase in energy efficiency meets or exceeds 20 percent: • Exceed California Title 24 Energy Efficiency performance standards for water heating and space heating and cooling, as deemed acceptable by the City. • Increase in insulation such that heat transfer and thermal bridging is minimized. • Limit air leakage through the structure or within the heating and cooling distribution system to	City of Moreno Valley Building and Safety Planning Division	Prior to Construction (once)	Prior to Issuance of Building Permits	Review of building plans and on-site inspection		Withhold Building Permits

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
minimize energy consumption. • Incorporate dual-paned or other energy efficient windows. • Incorporate energy efficient space heating and cooling equipment. • Use interior and exterior energy efficient lighting which exceeds the California Title 24 Energy Efficiency performance standards, as deemed acceptable by the City. Use automatic devices to turn off lights when they are not needed. • To the extent that they are compatible with landscaping guidelines established by the City, use shade-producing trees, particularly those that shade paved surfaces such as streets and parking lots and buildings at the project site. • Use paints and a surface color palette for the project emphasizing light and off-white colors which reflect heat away from the buildings. • Install a photovoltaic array (solar panels) or other source of renewable energy generation on-site, or otherwise acquire energy from the local utility that has been generated by renewable resources, to meet the project's office electricity needs. • Reduce energy demand associated with potable water conveyance using						

MV00170324

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
the following: ○ Landscaping palette emphasizing drought-tolerant plants; ○ Use of water-efficient irrigation techniques; and, ○ U.S. EPA Certified WaterSense labeled for equivalent faucets, high-efficiency toilets (HETs), and water-conserving shower heads. • Provide on-site bicycle storage/parking consistent with City of Moreno Valley requirements. • Provide on-site showers (one for males and one for females). Provide lockers for employees. • Establish a Transportation Management Association (TMA). The TMA will coordinate with other TMAs within the City to encourage and coordinate carpooling among building occupants. The TMA will advertise its services to building occupants, and offer transit and/or other incentives to reduce GHG emissions. A plan will be submitted by the TMA to the City within two months of project completion that outlines the measures implemented by the TMA, as well as contact information. • Provide preferential parking for carpools, vanpools or other						

MV00170325

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
alternative fuel vehicles. Locations and configurations of proposed preferential parking for carpools and vanpools are subject to review and approval by the City. Prior to final site plan approval, delineate preferential parking for carpools and vanpools on the project site plan. • Provide at least two electric vehicle charging stations. Locations and configurations of proposed charging stations are subject to review and approval by the City. Prior to issuance of the first building permit, delineate stub outs for charging stations on the project building plans. • Implement compressed workweek schedules; • Achieve at least 20% per year (as a percentage of previous percentage, not total trips) increase in percentage of consolidated trips carried by SmartWay carriers until it reaches a minimum of 90% of all long haul trips carried by SmartWay 1.0 or greater carriers. • Achieve at least 15% per year (as a percentage of previous percentage, not total trips) increase in percentage of long haul trips carried by SmartWay carriers until it reaches a minimum of 85% of all consolidator trips carried by SmartWay 1.0 or greater carriers.						

MV00170326

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
• Use of fleet vehicles conforming to 2010 air quality standards or better. • Installation of catalytic converters on gasoline-powered equipment. • Inclusion of electric powered and/or compressed natural gas fueled trucks and/or vehicles in fleets; • Establishment and use of carpool/vanpool programs, complemented by parking fees for single-occupancy vehicles; • Provision of preferential parking for EV and CNG vehicles; • Use of electrical equipment (instead of gasoline-powered equipment) for landscape maintenance; • Use of electric (instead of diesel or gasoline-powered) yard trucks; • Use of SmartWay 1.25 rated trucks. • Provide a display case or kiosk displaying transportation information including the RTA bus schedule in a prominent area accessible to employees. • Use landscape maintenance companies that use battery powered or electric equipment or contract only with commercial landscapers who operate with equipment that complies with the most recent California Air Resources Board certification standards, or standards adopted no

more than three years prior to date of use or any combination of these two themes.						
4.2.6.3B The project shall be designed to facilitate the reduction of waste generated by building occupants that is hauled to and disposed of in landfills by providing easily accessible areas that are dedicated to the collection and storage of recyclable materials including: paper, cardboard, glass, plastics, and metals. Locations of proposed recyclable materials collection areas are subject to review and approval by the City. Prior to Final Site Plan approval, locations of proposed recyclable materials collection areas shall be delineated on the project site plan.	City of Moreno Valley Building and Safety	Prior to Construction (once)	Prior to Issuance of Building Permits and Final Site Plan Approval	Review of final site plan and building plans and on-site inspection		Withhold Building Permits
BIOLOGICAL RESOURCES						
Mitigation Measure BIO-1: No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction survey shall be completed by a qualified biologist. The survey will identify special status avian species (if any) within the area of intended disturbance. In the event no special status avian species are identified within the limits of disturbance, no further mitigation is required. In the event such species are identified within the limits of ground disturbance,	City of Moreno Valley Planning Division	Prior to Grading	Prior to Issuance of Grading Permit	Submittal of Evidence that the pre-construction survey has been completed. Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
Mitigation Measure BIO-3 shall apply.						
Mitigation Measure BIO-2: No more than 72 hours prior to initiation of ground-disturbing activities, a pre-construction burrowing owl survey shall be completed by a qualified biologist for the planned disturbance area. The pre-construction burrowing owl surveys may be conducted as part of the survey required in **Mitigation Measure BIO-1**. A report detailing the findings of the pre-construction survey shall be submitted to the City prior to the initiation of ground-disturbing activities. In the event no burrowing owls are identified within the limits of ground disturbance, no further mitigation is required. In the event burrowing owls are identified within the limits of ground disturbance, **Mitigation Measures BIO-3** and **BIO-4** shall apply.	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit	Submittal of Evidence that a qualified biologist has been hired and the pre-construction survey has been completed. Submittal of a report of the survey findings.		Withhold Grading Permit
Mitigation Measures BIO-3. If nesting special status avian or burrowing owl species are determined to occupy a proposed area of disturbance a biological monitor will be present during construction to ensure no construction activity shall take place within 500 feet of an active nest/burrow until it has been determined by the biological monitor that the nest/burrow is no longer active, and all juveniles have fledged the nest/burrow.	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit			Withhold Grading Permit
Mitigation Measure BIO-4: If active burrowing owl burrows are detected outside the breeding season, then	City of Moreno Valley Planning Division	Prior to grading	Prior to Issuance of Grading Permit	Provide evidence to the City that the passive relocation		Withhold Grading Permit

MV00170329

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
passive and/or active relocation may be approved following consultation with the CDFG and/or USFWS. One-way doors may be installed as part of a passive relocation program. Burrowing owl burrows shall be excavated with hand tools by a qualified biologist when determined to be unoccupied, and backfilled to ensure that animals do not re-enter the holes/dens.				plan has been approved by CDFG and USFWS.		
CULTURAL RESOURCES						
Mitigation Measure CUL-1: Prior to construction involving excavation four feet or more below existing surface grade, the construction contractor shall provide evidence that a qualified paleontologist has been retained, and that the paleontologist(s) shall be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. If the paleontologist(s) do not find evidence for Pleistocene-era deposits once the maximum excavation depth is reached, monitoring shall be discontinued. In the event fossiliferous deposits are encountered, the following measures shall be implemented: • Monitoring shall be conducted by qualified paleontological monitor(s) of excavation in areas identified as likely to contain paleontological resources, including undisturbed older Pleistocene alluvium. Paleontological monitors shall be	City of Moreno Valley Planning Division	Prior to grading and on-going during ground disturbing activities.	Prior to Issuance of Grading Permit	Provide evidence to the City that a qualified paleontologist has been retained, and that the paleontologist(s) will be present during all grading and other significant ground-disturbing activities that reach four feet or more below existing surface grade. A report of findings shall be submitted to the City after the finalization of construction.		Withhold Grading Permit/ Issuance of a Stop Work Order

MV00170330

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
equipped to salvage fossils as they are unearthed, to avoid construction delays, and to remove samples of sediments that are likely to contain the remains of small fossil invertebrates and vertebrates. Monitors shall be empowered to temporarily halt or divert equipment to allow removal of abundant or large specimens. Monitoring may be reduced if the potentially fossiliferous units are determined upon exposure and examination by qualified paleontological personnel to have low potential to contain fossil resources. • Paleontological monitoring of any earthmoving will be conducted by a monitor, under direct guidance of a qualified paleontologist. Earthmoving in areas of the parcel where previously undisturbed sediments are buried, but not otherwise disturbed, will not be monitored. • Preparation of recovered specimens to a point of identification and permanent preservation, including washing of sediments to recover small invertebrates and vertebrates. • Identification and curation of specimens into a professional, fully accredited museum repository with permanent retrievable storage. The paleontologist must have a written						

MV00170331

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
repository agreement in hand prior to the initiation of mitigation activities. • Preparation or a report of findings with and appended itemized inventory of specimens. The report and report and inventory, when submitted to the City of Moreno Valley along with confirmation of the curation of recovered of recovered specimens into an established, accredited museum repository, will signify completion of the program to mitigate impacts to paleontological resources						
GEOLOGY AND SOILS						
Mitigation Measure GEO-1: Prior to the issuance of grading permits, any existing low density soils and/or saturated soils shall be removed to competent natural soil under the inspection of the Soils Engineering Firm. After the exposed surface has been cleansed of debris and/or vegetation, it shall be scarified until it is uniform in consistency, brought to the proper moisture content and compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557). In any area where a transition between fill and native soil or between bedrock and soil are encountered, additional excavation beneath foundations and slabs will be necessary in order to provide uniform support and	City of Moreno Valley Planning Division Engineering	Prior to grading	Prior to Issuance of Grading Permit	Review of construction documents and on-site inspection		Withhold Grading Permit

MV00170332

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
avoid differential settlement of the structure. The on-site soils or approved import soils may be utilized for the compacted fill, provided they are free of any deleterious materials and shall not contain any rocks, brick, asphaltic concrete, concrete, or other hard materials greater than eight inches in maximum dimensions. Any import soil must be approved by the Soils Engineering firm a minimum of 24 hours prior to importation to the site. The approved fill soils shall be placed in layers not in excess of six inches in thickness. Each lift shall be uniform in thickness and thoroughly blended. The fill soils shall be brought to within 2 percent of the optimum moisture content, unless otherwise specified by the Soils Engineering firm. Each lift shall be compacted to a minimum of 90 percent relative compaction (in accordance with ASTM: D-1557) and approved prior to the placement of the next layer of soil. Compaction tests shall be obtained at the discretion of the Soils Engineering firm but to a minimum of one test for every 500 cubic yards placed and/or for every two feet of compacted fill placed. The minimum relative compaction shall be obtained in accordance with accepted methods in the construction industry. The final grade of the structural areas shall be in a dense and smooth condition prior to						

MV00170333

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
placement of slabs-on-grade or pavement areas. No fill soils shall be placed, spread, or compacted during unfavorable weather conditions. When the grading is interrupted by heavy rains, compaction operations shall not be resumed until approved by the Soils Engineering firm. It should be noted that the above measure may be modified by the Final Geotechnical or Soils Report.						
Mitigation Measure GEO-2: Prior the issuance of grading permits, the project proponent shall inform the project engineers, architects, owner, maintenance personnel, and other interested parties of the Expansive Soil Guidelines provided in the project's geotechnical analysis [Geotechnical Engineering Investigation Proposed Industrial Development Southwest Corner of Perris Boulevard and Grove View Road Moreno Valley, California, NorCal Engineering, March 7, 2007]. The recommendations identified in the project's Expansive Soil Guidelines shall be implemented by the project engineers, architects, owner, maintenance personnel, and other interested parties in the applicable design guidelines. Applicable design guidelines shall be included and implemented in the project's grading plans. GREENHOUSE GASES AND GLOBAL CLIMATE CHANGE						
4.3.6.1A Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that building features have been incorporated in building plans as required by Title 24 of the California Code of Regulations. These features include but are not limited to the following: • Exterior windows in the office areas shall utilize window treatments for efficient energy conservation. • Per CALGreen Code requirements, water-efficient fixtures and appliances, including but not limited to low-flow faucets, dual-flush toilets minimizing water consumption by 20 percent from the Building Standards Code baseline water consumption shall be used. • Per CALGreen Code requirements, a Commissioning Plan shall be prepared and all building systems (e.g., heating, ventilation, and air-conditioning [HVAC], irrigation systems, lighting, water heating) shall be commissioned by the Commissioning Authority. • Per CALGreen Code, restrict watering methods (e.g., prohibit systems that apply water to non-vegetated surfaces) and control	City of Moreno Valley Building and Safety Planning Division	Prior to construction	Prior to issuance of building permits	Review of construction documents and on-site inspection		Withhold Building Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
runoff.						
4.3.6.1B Prior to the issuance of building permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been be incorporated into the design and construction of the project: • Encourage use of locally produced and/or manufactured building materials for at least 10 percent of the construction materials used for the project. • Encourage use of "Green Building Materials," such as those materials that are resource efficient, and recycled and manufactured in an environmentally friendly way, for at least 10 percent of the project. • Limit unnecessary idling of construction equipment. A reduction in equipment idling would reduce fuel consumption, and therefore, GHG emissions. • Maximize the use of electricity from the power grid by replacing diesel- or gasoline-powered equipment where feasible. This would reduce GHG emissions because electricity can be produced more efficiently at centralized power plants. • Design the project building to exceed	City of Moreno Valley Building and Safety Planning Division	Prior to construction	Prior to issuance of building permits	Review of construction documents/building plans and on-site inspection		Withhold Building Permit

the California Building Code's (CBC) 2008 Title 24 energy standard by 20%, including, but not limited to, any combination of the following: ○ Increase insulation such that heat transfer and thermal bridging is minimized. ○ Limit air leakage through the structure or within the heating and cooling distribution system to minimize energy consumption. ○ Incorporate ENERGY STAR or better rated windows in the office area, space heating and cooling equipment, light fixtures, appliances, or other applicable electrical equipment. • Provide a landscape and development plan for the project that takes advantage of shade, prevailing winds, and landscaping. The landscaping plan shall be prepared by a registered landscape architect who will consider the following: ○ Plant at least 50 percent low-ozone forming potential (Low-OFP) trees and shrubs, preferably native, drought-resistant species, to meet city/county landscaping requirements. ○ Plant Low-OFP, native, drought-

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
resistant, tree and shrub species, 20% in excess of that already required by city or county ordinance. Consider roadside, sidewalk, and driveway shading. • Install efficient lighting and lighting control systems. Use daylight as an integral part of the lighting systems in buildings. • Install light-colored "cool" roof and cool pavements. • Install energy-efficient heating and cooling systems, appliances and equipment, and control systems. • Install solar or light-emitting diodes (LEDs) for outdoor lighting. • Install electrical outlets on the exterior walls of the warehouse/office building (and perhaps parking lots) to promote the use of electric landscape maintenance equipment.						
4.3.6.1C Prior to the issuance of occupancy permits, the project applicant shall provide evidence to the City of Moreno Valley that the following measures have been incorporated into the operation of the project: • The project applicant shall use low	City of Moreno Valley Building and Safety Planning Division	Prior to building permit and occupancy	Prior to issuance of occupancy permit	Review of construction documents and on-site inspection		Withhold Occupancy Permit

Global Warming refrigerants or natural refrigerants (ammonia, propane, carbon dioxide [CO_2]) for refrigeration and fire suppression equipment. • Provide vegetative or man-made exterior wall shading devices for east-, south-, and west facing walls with windows in the office areas. • Devise a comprehensive water conservation strategy appropriate for the project and its location. The strategy may include the following, plus other innovative measures that may be appropriate: • Install drought tolerant plants for landscaping. • Use reclaimed water for landscape irrigation within the project. Install the infrastructure to deliver and use reclaimed water. • Install water-efficient irrigations systems, such as weather-based and soil-moisture-based irrigation controllers and sensors for landscaping according to the California Department of Water Resources Model Efficient Landscape Ordinance. • Provide employee education about reducing waste and available recycling services.

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
HYDROLOGY AND WATER QUALITY						
Mitigation Measure HYD-01: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall provide evidence to the City that a Notice of Intent (NOI) with the Regional Water Quality Control Board has been filed to be covered under the State NPDES General Construction Permit for discharge of stormwater associated with construction activities.	City of Moreno Engineering	Prior to grading	Prior to the Issuance of Grading Permits	Submittal of copy of Notice of Intent to City filed with the RWQCB		Withhold Grading Permits
Mitigation Measure HYD-02: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall submit to the State Water Quality Control Board, a Storm Water Pollution Prevention Plan (SWPPP). The SWPPP shall include a surface water control plan and erosion control plan citing specific measures to control on-site and off-site erosion during the entire grading and construction period. Additionally, the SWPPP shall identify structural and nonstructural BMPs to control sediment and non-visible discharges from the site. BMPs to be implemented in the SWPPP may include but shall not be limited to the following: Sediment discharges from the site may be controlled by the following: gravel bags, silt fences, straw wattles and temporary debris basins (if deemed necessary), and other discharge	City of Moreno Engineering	Prior to grading	Prior to the Issuance of Grading Permits	Review and approval of SWPPP		Withhold Grading Permits

MV00170340

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
control devices. The construction and condition of the BMPs will be periodically inspected during construction, and repairs will be made when necessary as required by the SWPPP.						
Materials that have the potential to contribute non-visible pollutants to stormwater must not be placed in drainage ways and must be contained, elevated, and placed in temporary storage containment areas.						
All loose piles of soil, silt, clay, sand, debris, and other earthen material shall be protected in a reasonable manner to eliminate any discharge from the site. Stockpiles will be surrounded by silt fences.						
The SWPPP will include inspection forms for routine monitoring of the site during the construction phase to ensure NPDES compliance.						
Additional BMPs and erosion control measures will be documented in the SWPPP and utilized if necessary.						
The SWPPP will be kept on site for the entire duration of project construction and will also be available to the local RWQCB for inspection at any time.						
In the event that it is not feasible to implement the above BMPs, the City of Moreno Valley can make a determination						

MV00170341

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
that other BMPs will provide equivalent or superior treatment either on or off site.						
Mitigation Measure HYD-03: Prior to the issuance of grading permits, the project proponent shall provide evidence to the City that the following provisions have been added to construction contracts for the project: • The Construction Contractor shall be responsible for performing and documenting the application of BMPs identified in the SWPPP. Weekly inspections shall be performed on sediment control measures called for in the SWPPP. Monthly reports shall be maintained by the Contractor and submitted to the City for inspection. In addition, the Contractor will also be required to maintain an inspection log and have the log on site to be reviewed by the City of Moreno Valley and the representatives of the Regional Water Quality Control Board.	City of Moreno Engineering	During grading and construction	Prior to Grading	Review of construction documents and on-site inspection		Withhold Grading Permit
Mitigation Measure HYD-04: Prior to grading plan approval and the issuance of a grading permit by the City, the project proponent shall receive approval from the City of Moreno Valley for a Final Water Quality Management Plan (F-WQMP). The F-WQMP shall specifically identify pollutants of concern, site design, source control, and treatment control BMPs that	City of Moreno Engineering	Prior to grading	Prior to Issuance of Grading Permit	Submittal of WQMP to City for review and approval		Withhold Grading Permit

Mitigation Measure No. / Implementing Action	Responsible for Monitoring	Monitoring Frequency	Timing of Verification	Method of Verification	Verified Date/ Initials	Sanctions for Non-Compliance
shall be used on site to control predictable pollutant runoff in order to reduce impacts to water quality to the maximum extent practicable.						
Mitigation Measure HYD-05: Prior to grading plan approval and the issuance of a grading permit, the project proponent shall submit a detailed grading plan and drainage report, with supporting engineering calculations, to the City Engineer for review and approval. The plan and report shall incorporate relevant requirements identified by the City and/or site-specific geotechnical investigations. The plan and report shall provide evidence that the storm drainage system would be adequate to convey water for the 100-year storm event from the project site and that the post-development flows exiting the proposed project site are less than or equal to pre-development flows. 3.0 Effects of Construction Noise

3.1 Introduction

Construction noise in the community may not pose a health risk or damage peoples' sense of hearing, but it can adversely affect peoples' quality of life. To some degree, construction noise can be a contributing factor to the degradation of someone's health in that it can cause people to be irritated and stressed and can interrupt their ability to sleep - all of which may lead to higher blood pressure, anxiety, and feelings of animosity toward the people or agencies responsible for producing the noise.

In fact, several of the traditional definitions of "noise" (i.e. unwanted or undesirable sound) can be associated with construction noise. Construction noise can be considered to:

- be too loud;
- be impulsive;
- contain annoying pure tones;
- occur unexpectedly;
- occur at undesirable times of day; and/or
- interrupt people's activities.

Construction noise has the potential to disturb people at home in their residences, in office buildings or retail businesses, in public institutional buildings, at locations of religious services, while attending sporting events, or when on vacation.

EXECUTIVE SUMMARY

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, Connelly) was enacted in September 1987. Under this Act, stationary sources of air pollution are required to report the types and quantities of certain substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks posed by those facilities, notify nearby residents of significant risks and reduce emissions from significant sources.

The Technical Support Document for Cancer Potency Factors (TSD) contains cancer unit risks and potency factors for 107 of the 201 carcinogenic substances or groups of substances for which emissions must be quantified in the Air Toxics Hot Spots program. These unit risks are used in the cancer risk assessment of facility emissions.

The purposes of this revision to the TSD is to provide updated calculation procedures used to derive the estimated unit risk and cancer potency factors, and to describe the procedures used to consider the increased susceptibility of infants and children compared to adults to carcinogens. This updates cancer risk assessment methods originally laid out in the California Department of Health Services' Guidelines for Chemical Carcinogen Risk Assessment (CDHS, 1985), and more recently summarized in the previous Hot Spots technical support document Part II (OEHHA, 2005a). Summaries of cancer potency factors and the underlying data are provided in Appendix A and B. [these did not undergo revision and are not included in this review package.]

The procedures used to consider the increased susceptibility to carcinogens of infants and children as compared to adults include the use of age-specific weighting factors in calculating cancer risks from exposures of infants, children and adolescents, to reflect their anticipated special sensitivity to carcinogens

This document is one part of the Air Toxics Hot Spots Program Risk Assessment Guidelines. The other documents originally included in the Guidelines are Part I: Technical Support Document for the Determination of Acute Toxicity Reference Exposure Levels for Airborne Toxicants; Part III: Technical Support Document for Determination of Noncancer Chronic Reference Exposure Levels; Part IV: Technical Support Document for Exposure Assessment and Stochastic Analysis; Part V: Air Toxic Hot Spots Program Risk Assessment Guidelines. As a part of the same revision process which led to production of this revised TSD on cancer potencies, the original TSDs for Acute and Chronic Reference Exposure Levels have been replaced with a new unified TSD for Acute, 8-hour and Chronic Reference Exposure Levels.

The major changes to the TSD include the following:

> Based on the OEHHA analysis of the potency by lifestage at exposure, OEHHA proposes weighting cancer risk by a factor of 10 for exposures that occur from birth to 2 years of age, and by a factor of 3 for exposures that occur from 2 years through 15 years of age. We propose to apply this weighting factor to all carcinogens, regardless of purported mechanism of action, unless chemical-specific data exist to the contrary. In cases where

MV00170353

there are adequate data for a specific carcinogen of potency by age, we would use the data to make any adjustments to risk.

OEHHA proposes to use the Benchmark Dose method to compute potency factors rather than the more traditional linearized multistage model (LMS), although the LMS will still be used in some instances. The BMDL model essentially uses an empirical fit to the data (usually best with the multistage model), and then extrapolates with a straight line from the 95 % lower confidence limit of the BMD (BMDL) to zero. This method is simpler and does not assume any underlying theoretical mechanisms at the low dose range. The BMDL method results in very similar estimates of potency as the LMS method.

OEHHA will use scaling based on body weight to the ¾ power, rather than to the 2/3 power.

OEHHA's evaluations of the carcinogenicity of chemicals generally follow the guidelines laid out by IARC for identification and classification of potential human carcinogens, which are described in detail in the most recent revision of the *Preamble* to the IARC monographs series (IARC, 2006).

MV00170354

PREFACE

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, Connelly) was enacted in September 1987. Under this Act, stationary sources are required to report the types and quantities of certain substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to collect emission data, identify facilities having localized impacts, ascertain health risks posed by those facilities, notify nearby residents of significant risks and reduce emissions from significant sources.

The Technical Support Document for Cancer Potency Factors (TSD) contains cancer unit risks and potency factors for 107 of the 201 carcinogenic substances or groups of substances for which emissions must be quantified in the Air Toxics Hot Spots program. These unit risks are used in risk assessment of facility emissions. The TSD provides updated calculation procedures used to derive the estimated unit risk and cancer potency factors, and procedures to consider early-life susceptibility to carcinogens. Summaries of cancer potency factors and the underlying data are provided in Appendix A and B. [these did not undergo revision and are not included in this review package.]

In this document, OEHHA is responding to the requirements of the 1999 Children's Environmental Health Protection Act, (SB25, Escutia) by revising the procedures for derivation and application of cancer potency factors to take account of general or chemical-specific information which suggests that children may be especially susceptible to certain carcinogens (OEHHA, 2001a). The revised cancer potency derivation procedures described will not be used to impose any overall revisions of the existing cancer potencies, although they do reflect updated methods of derivation. However, individual cancer potency values will be reviewed as part of the ongoing re-evaluation of health values mandated by SB 25, and revised values will be listed in updated versions of the appendices to this document as necessary. The revisions also include the use of weighting factors in calculating cancer risks from exposures of infants, children and adolescents, to reflect their anticipated special sensitivity to carcinogens. Similar legal mandates to update risk assessment methodology and cancer potencies apply to the OEHHA program for development of Public Health Goals (PHGs) for chemicals in drinking water, and Proposition 65 No Significant Risk Levels (NSRLs). The NSRLs may also be revised to reflect concerns for children's health. Revising these numbers will require the originating program to reconsider the value in an open public process. For example, OEHHA would need to release any revised potency factors for public comment and review by the Scientific Review Panel on Toxic Air Contaminants (SRP) prior to adoption under the TAC program. The procedures for outside parties to request reevaluation of cancer potency values by the programs which originated those values are listed in Appendix G.

Appendices A and B provide previously adopted Cal/EPA values which were included in the previous version of the TSD for Cancer Potency Factors (OEHHA, 2005a). Cal/EPA values were developed under the Toxic Air Contaminant (TAC) program, the PHG program, the Proposition 65 program, or in some cases specifically for the Air Toxics Hot Spots program. All the Cal/EPA values are submitted for public comments and external peer review prior to adoption by the program of origin. In the future, new values developed by the Toxic Air

MV00170355

Contaminants or Hot Spots programs or other suitable sources will be added as these are approved.

Some U.S. EPA IRIS cancer unit risk values were adopted under the previous versions of these guidelines, and these values will continue to be used unless and until revised by Cal/EPA. U.S. EPA has recently revised its cancer risk assessment guidelines (U.S. EPA, 2005a). Some of the recommended changes in methodology could result in slightly different potency values compared to those calculated by the previous methodology, although in practice a number of the recommendations (for example, the use of ¾ power of the body weight ratio rather than ⅔ power for interspecies scaling) have been available in draft versions of the revised policy for some time and appear in many more recent assessments. U.S. EPA has stated that cancer potency values listed in IRIS will not be revisited solely for the purpose of incorporating changes in cancer potency value calculation methods contained in the revised cancer risk assessment guidelines. U.S. EPA has also issued supplementary guidelines on assessing cancer risk from early-life exposure (U.S. EPA, 2005b).

OEHHA uses a toxic equivalency factor procedure for dioxin-like compounds, including polychlorinated dibenzo-*p*-dioxins, dibenzofurans and polychlorinated biphenyls (PCBs). The Toxicity Equivalency Factor scheme (TEF_{WHO-97}) developed by the World Health Organization/European Center for Environmental Health (WHO-ECEH) is used for determining cancer unit risk and potency values for these chemicals where individual congener emissions are available (Appendix C).

This document is one part of the Air Toxics Hot Spots Program Risk Assessment Guidelines. The other documents originally included in the Guidelines are Part I: Technical Support Document for the Determination of Acute Toxicity Reference Exposure Levels for Airborne Toxicants; Part III: Technical Support Document for Determination of Noncancer Chronic Reference Exposure Levels; Part IV: Technical Support Document for Exposure Assessment and Stochastic Analysis; Part V: Air Toxic Hot Spots Program Risk Assessment Guidelines. As a part of the same revision process which led to production of this revised TSD on cancer potencies, the original TSDs for Acute and Chronic Reference Exposure Levels have been replaced with a new unified TSD for Acute, 8-hour and Chronic Reference Exposure Levels.

APPENDICES

Appendix A. A lookup table containing unit risk and cancer potency values.

Appendix B. Chemical-specific summaries of the information used to derive unit risk and cancer potency values.

Appendix C. A description of the use of toxicity equivalency factors for determining unit risk and cancer potency factors for polychlorinated dibenzo-*p*-dioxins, dibenzofurans and dioxin-like polychlorinated biphenyls.

Appendix D. A listing of Toxic Air Contaminants identified by the California Air Resources Board.

Appendix E. Descriptions of the International Agency for Research on Cancer (IARC) and U.S. Environmental Protection Agency (U.S. EPA) carcinogen classifications.

Appendix F. An asbestos quantity conversion factor for calculating asbestos concentrations expressed as 100 fibers/m^3 from asbestos concentrations expressed as $\mu g/m^3$.

Appendix G. Procedures for revisiting or delisting cancer potency factors by the program of origin.

Appendix H. Exposure routes and studies used to derive cancer unit risks and slope factors.

Appendix I. "Assessing susceptibility from early-life exposure to carcinogens": Barton *et al.*, 2005 (from *Environmental Health Perspectives)*.

Appendix J. "In Utero and Early Life Susceptibility to Carcinogens: The Derivation of Age-at-Exposure Sensitivity Measures" – conducted by OEHHA's Reproductive and Cancer Hazard Assessment Branch.

Appendix K. Additions and corrections from prior document versions.

MV00170358

INTRODUCTION

The Technical Support Document (TSD) for Describing Available Cancer Potency Factors provides technical information support for the Air Toxics Hot Spots Program Risk Assessment Guidelines. The TSD consists of 12 sections:

1. The TSD introduction.
2. A description of the methodologies used to derive the unit risk and cancer potency values listed in the lookup table.
3. A lookup table containing unit risk and cancer potency values. (Appendix A)
4. Chemical-specific summaries of the information used to derive unit risk and cancer potency values. (Appendix B).
5. A description of the use of toxicity equivalency factors for determining unit risk and cancer potency factors for polychlorinated dibenzo-*p*-dioxins, dibenzofurans and dioxin-like polychlorinated biphenyls (Appendix C).
6. A listing of Toxic Air Contaminants identified by the California Air Resources Board (Appendix D).
7. Descriptions of the International Agency for Research on Cancer (IARC) and U.S. Environmental Protection Agency (U.S. EPA) carcinogen classifications (Appendix E).
8. An asbestos quantity conversion factor for calculating asbestos concentrations expressed as 100 fibers/m^3 from asbestos concentrations expressed as $\mu g/m^3$ (Appendix F).
9. Procedures for revisiting or delisting cancer potency factors by the program of origin (Appendix G).
10. Exposure routes and studies used to derive cancer unit risks and slope factors (Appendix H).
11. "Assessing susceptibility from early-life exposure to carcinogens": Barton *et al.*, 2005 (from *Environmental Health Perspectives)* (Appendix I).
12. "In Utero and Early Life Susceptibility to Carcinogens: The Derivation of Age-at-Exposure Sensitivity Measures" – conducted by OEHHA's Reproductive and Cancer Hazard Assessment Branch (Appendix J)

MV00170359

SELECTION OF CANCER POTENCY VALUES

The Office of Environmental Health Hazard Assessment (OEHHA) has developed a number of cancer potencies for use in the Toxic Air Contaminants and Air Toxics Hot Spots programs. This document also provides summaries of cancer potency factors which were originally developed for other California Environmental Protection Agency (Cal/EPA) programs, or by the U.S. EPA. These were reviewed for accuracy, reliance on up-to-date data and methodology, and applicability in the context of the Air Toxics Hot Spots program. Values found appropriate were adopted after public and peer review rather than devoting the resources necessary for a full *de novo* assessment. Thus, cancer potency values (CPF) included in the Technical Support Document (TSD) for Cancer Potency Factors were from the following sources:

1. Toxic Air Contaminant documents
2. Standard Proposition 65 documents
3. U.S.EPA Integrated Risk Information Systems (Office of Health and Environmental Assessment, U.S.EPA)
4. Expedited Proposition 65 documents
5. Other OEHHA assessments , for example for the drinking water program.

All the cancer potency value sources used generally follow the recommendations of the National Research Council on cancer risk assessment (NRC, 1983, 1994). All Cal/EPA program documents undergo a process of public comment and scientific peer review prior to adoption, although the procedures used vary according to the program. The publication procedure for Toxic Air Contaminant documents includes a public comment period and review by the Scientific Review Panel on Toxic Air Contaminants (SRP) before identification of a Toxic Air Contaminant by the Air Resources Board of the California Environmental Protection Agency (Cal/EPA). Furthermore, a petition procedure is available to initiate TAC document review and revision if appropriate because of new toxicity data. Documents developed for the Air Toxics Hot Spots program similarly undergo public comment and peer review by the SRP before adoption by the Director of OEHHA. The standard Proposition 65 document adoption procedure includes a public comment and external peer review by the Proposition 65 Carcinogen Identification Committee. The expedited Proposition 65 document adoption procedure included a public comment period. Risk assessments prepared for development of Public Health Goals (PHGs) for chemicals in drinking water are subject to two public comment periods before the final versions and responses to comments are published on the OEHHA Web site. PHG documents may also receive external peer review. Documents from U.S. EPA's Integrated Risk Information System (IRIS) receive external peer review and are posted on the Internet for public viewing during the external peer review period, and any public comments submitted are considered by the originating office. Additionally, public comment may be solicited during the document posting period. Future preference for use of developed cancer potency factors/unit risks will be done on a case by case basis. Preference will be given to those assessments most relevant to inhalation exposures of the California population, to the most recent derivations using the latest data sets and scientific methodology, and to those having undergone the most open and extensive peer review process.

MV00170360

CANCER RISK ASSESSMENT METHODOLOGIES

This section describes in general the methodologies used to derive the cancer unit risk and potency factors listed in this document. As noted in the Preface to this document, no new cancer unit risks or potency factors were developed for this document. All of the values contained here were previously developed in documents by Cal/EPA or U.S. EPA. Following the recommendations of the National Academy of Sciences (NRC, 1983), Cal/EPA and U.S. EPA have both used formalized cancer risk assessment guidelines, the original versions of which (California Department of Health Services, 1985; U.S. EPA, 1986) were published some time ago. Both these guidelines followed similar methodologies.

In the twenty years since these original guidelines were published there have been a number of advances in the methodology of cancer risk assessment. There have additionally been considerable advances in the quantity of data available not only from animal carcinogenesis bioassays and epidemiological studies, but also from mechanistic studies of carcinogenesis and related phenomena. Some of these advances have been incorporated into newer risk assessments by both agencies on a more or less *ad hoc* basis. There has also been an ongoing effort to provide updated risk assessment guidance documents. In 1995, U.S. EPA released for public comment the "Proposed and Interim Guidelines for Carcinogen Risk Assessment", which was the first of several drafts released for public comment. Many risk assessments appearing since then have used elements of the recommendations contained in that document, in spite of its draft status. A final version of the U.S. EPA's revised cancer risk assessment guidelines has now been released (U.S. EPA, 2005a). Although these new guidelines incorporate a number of substantial changes from their predecessors (U.S. EPA, 1986; 1995), U.S. EPA has stated that cancer potency values listed in IRIS will not be revisited solely for the purpose of incorporating changes in cancer potency value calculation methods.

Cal/EPA has not produced a revised cancer risk assessment guideline document to replace the original version (DHS, 1985). Rather, Cal/EPA has relied on incorporating new data and methodologies as these became available, and described the methods used on a case by case basis in the individual risk assessment documents where these went beyond the original guidance. However, this revision of the TSD for cancer potencies provides a convenient opportunity to summarize the current status of the methodology used by OEHHA for the air toxics programs, and also to highlight points of similarity to, and difference from, the recommendations of U.S. EPA (2005a).

In this document, OEHHA intends to follow the recommendations of the NRC (1994) in describing a set of clear and consistent principles for choosing and departing from default cancer risk assessment options. NRC identified a number of objectives that should be taken into account when considering principles for choosing and departing from default options. These include, "protecting the public health, ensuring scientific validity, minimizing serious errors in estimating risks, maximizing incentives for research, creating an orderly and predictable process, and fostering openness and trustworthiness". The OEHHA cancer risk methodologies discussed in this document are intended to generally meet those objectives cited above.

MV00170361

Hazard Identification

This section will describe: 1) how weight of evidence evaluations are used in hazard evaluation; 2) guidelines for inferring causality of effect; 3) the use of human and animal carcinogenicity data, as well as supporting evidence (e.g. genetic toxicity and mechanistic data); 4) examples of carcinogen identification schemes.

Evaluation of Weight of Evidence

In evaluating the range of evidence on the toxicity and carcinogenicity of a compound, mixture or other agent, a "weight-of-evidence" approach is generally used to describe the body of evidence on whether or not exposure to the agent causes a particular effect. Under this approach, the number and quality of toxicological and epidemiological studies, as well as the consistency of study results and other sources of data on biological plausibility, are considered. Diverse and sometimes conflicting data need to be evaluated with respect to possible explanations of differing results. Consideration of methodological issues in the review of the toxicological and epidemiological literature is important in evaluating associations between exposure to an agent and animal or human health effects. This aspect of the evaluation process has received particular emphasis with respect to epidemiological data, where concerns as to the statistical and biological significance and reliability of the data and the impacts of confounding and misclassification are pressing. Such concerns are also relevant to some extent in the interpretation of animal bioassay data and mechanistic studies. Although the test animals, laboratory environment and characterization of the test agent are usually much better controlled than the equivalent parameters in an epidemiological study, the small sample size can be problematic. In addition, there are uncertainties associated with extrapolation of biological responses from test animal species to humans.

Criteria for Causality

There has been extensive discussion over the last two centuries on causal inference. This has been particularly with regard to epidemiological data, but is also relevant to interpretation of animal studies. Most epidemiologists utilize causal inference guidelines based on those proposed by Bradford Hill (1971). OEHHA has relied on these and on recommendations by IARC (2006), the Institute of Medicine (2004), the Surgeon General's Reports on Smoking (U.S. DHHS, 2004) and standard epidemiologic texts (*e.g.* Lilienfeld and Lilienfeld, 1980; Rothman and Greenland, 1998). The criteria for determination of causality used by OEHHA have been laid out in various risk assessment documents. The summary below is adapted from the Health Effects section of the document prepared to support the identification of environmental tobacco smoke (ETS) as a Toxic Air Contaminant (OEHHA, 2005b).

1. *Strength of Association.* A statistically significant strong association, which is easier to detect if there is a high relative risk, between a factor and a disease is often viewed as an important criterion for inferring causality because, all other things being equal, a strong and statistically significant association makes alternative explanations for the disease less likely. However, as discussed in Rothman and Greenland (1998), the fact that a relative risk is small in magnitude does not exclude a casual association between the risk factor

MV00170362

and the outcome in question. Since it is more difficult to detect (i.e., reach statistical significance) a small magnitude risk, ~~they are~~it is just as likely to ~~be causal~~indicate causality as a larger magnitude risks.

When assessing all evidence, it is important to consider the strength of the study design (particularly controlling for confounding variables, obtaining an unbiased sample, measurement error) and the level of statistical significance (i.e., the ability to exclude a Type I [false positive] error). The power of the study to detect biologically meaningful effects (i.e., the risk of a Type II [false negative] error) is important in considering studies that do not reach traditional (i.e., P<.05) statistical significance, particularly if the biological endpoint is serious. If the outcome is serious and the study small (i.e., low power), a larger P value (e.g., P<.10) may be adequate evidence for identifying an effect.

There are a number of examples of statistically significant, small magnitude associations that are widely accepted as causal, such as causal links between air pollution and cardiovascular/pulmonary mortality and between second-hand smoke exposure and various cancers and heart disease. From a public health perspective, even a small magnitude increase in risk for a common disease can mean large numbers of people affected by the health outcome when exposure is frequent and widespread, as measured by the population attributable risk or attributable fraction. Small magnitude of association must not be confused with statistical significance, which is much more important.

2. *Consistency of Association.* If several investigations find an association between a factor and a disease across a range of populations, geographic locations, times, and under different circumstances, then the factor is more likely to be causal. Consistency argues against hypotheses that the association is caused by some other factor(s) that varies across studies. Unmeasured confounding is an unlikely explanation when the effect is observed consistently across a number of studies in different populations.

   Associations that are replicated in several studies of the same design or using different epidemiological approaches or considering different sources of exposure and in a number of geographical regions are more likely to represent a causal relationship than isolated observations from single studies (IARC, 2006). If there are inconsistent results among investigations, possible reasons are sought, such as adequacy of sample size or control group, methods used to assess exposure, or range in levels of exposure. The results of studies judged to be rigorous are emphasized over those of studies judged to be methodologically less rigorous. For example, studies with the best exposure assessment are more informative for assessing the association between ETS and breast cancer than studies with limited exposure assessment, all else being equal.

3. *Temporality.* Temporality means that the factor associated with causing the disease occurs in time prior to development of the disease. The adverse health effect should occur at a time following exposure that is consistent with the nature of the effect. For example, respiratory irritation immediately following exposure to an irritant vapor is temporally consistent, whereas ~~effects~~ irritation noted only years later may not be. On the other hand, tumors, noted immediately following exposure, might be temporally

MV00170363

inconsistent with a causal relationship, but tumors arising after a latency period of months (in rodents) or years (in rodents or humans) would be temporally consistent.

4. *Coherence and Biological Plausibility.* A causal interpretation cannot conflict with what is known about the biology of the disease. The availability of experimental data or mechanistic theories consistent with epidemiological observations strengthens conclusions of causation. For example, the presence of known carcinogens in tobacco smoke supports the concept that exposure to tobacco smoke could cause increased cancer risk. Similarly, if the mechanism of action for a toxicant is consistent with development of a specific disease, then coherence and biological plausibility can be invoked. It should be noted that our understanding of the biology of disease, and therefore biological plausibility, changes in light of new information which is constantly emerging from molecular biology (including epigenetics), and from new clinical and epidemiological investigations revealing effects influenced by genetic polymorphisms, pre-existing disease, and so forth.

5. *Dose-Response.* A basic tenet of toxicology is that increasing exposure or dose generally increases the response to the toxicant. While dose-response curves vary in shape and are not necessarily always monotonic, an increased gradient of response with increased exposure makes it difficult to argue that the factor is not associated with the disease. To argue otherwise necessitates that an unknown factor varies consistently with the dose of the substance and the response under question. While increased risk with increasing levels of exposure is considered to be a strong indication of causality, absence of a graded response does not exclude a causal relationship (IARC, 2006).

   The dose-response curves for specific toxic effects may be non-monotonic. Under appropriate circumstances, where the dose response shows saturation, the effect of exposures could be nearly maximal, with any additional exposure having little or no effect. In some instances, a response is seen strongly in susceptible subpopulations, and the dose-response is masked by mixing susceptible and non-susceptible individuals in a sample. Further, there are examples of U-shaped or inverted U-shaped dose-response curves, (e.g., for endocrine disrupters) (Almstrup et al., 2002; Lehmann et al., 2004). Finally, timing of exposure during development may mask an overall increase in risk with increasing dose.

6. *Specificity.* Specificity is generally interpreted to mean that a single cause is associated with a single effect. It may be useful for determining which microorganism is responsible for a particular disease, or associating a single carcinogenic chemical with a rare and characteristic tumor (e.g., liver angiosarcoma and vinyl chloride, or mesothelioma and asbestos). However, the concept of specificity is not helpful when studying diseases that are multifactorial, or toxic substances that contain a number of individual constituents, each of which may have several effects and/or target sites.

7. *Experimental evidence.* While experiments are often conducted over a short period of time or under artificial conditions (compared to real-life exposures), experiments offer the opportunity to collect data under highly controlled conditions that allow strong causal conclusions to be drawn. Experimental data that are consistent with epidemiological

MV00170364

results strongly support conclusions of causality. There are also "natural experiments" that can be studied with epidemiological methods, such as when exposure of a human population to a substance declines or ceases; if the effect attributed to that exposure decreases, then there is evidence of causality. One example of this is the drop in heart disease death and lung cancer risk after smoking cessation.

It should be noted that the causal criteria are guidelines for judging whether a causal association exists between a factor and a disease, rather than hard-and-fast rules. Lilienfeld and Lilienfeld (1980) note that "*In medicine and public health, it would appear reasonable to adopt a pragmatic concept of causality. A causal relationship would be recognized to exist whenever evidence indicates that the factors form part of the complex of circumstances that increases the probability of the occurrence of disease and that a diminution of one or more of these factors decreases the frequency of that disease. After all, the reason for determining the etiological factors of a disease is to apply this knowledge to prevent the disease.*" Rothman and Greenland (2005) discuss the complexities of causation and the use of rules and deductive methods in causal inference. They also concur with Bradford Hill and others that a determination of causality is a pragmatic conclusion rather than an absolute verdict, and advocate that these criteria should be seen as "*deductive tests of causal hypotheses*".

Data sources

Human studies: epidemiology, ecological studies and case reports

The aim of a risk assessment for the California Air Toxics programs is to determine potential impact on human health. Ideally therefore, the hazard identification would rely on studies in humans to demonstrate the nature and extent of the hazard. However, apart from clinical trials of drugs, experimental studies of toxic effects in human subjects are rarely undertaken or justifiable. Pharmacokinetic studies using doses below the threshold for any toxic effect have been undertaken for various environmental and occupational agents, but are not usually regarded as appropriate for suspected carcinogens.

The human data on carcinogens available to the risk assessor therefore mostly consist of epidemiological studies of existing occupational or environmental exposures. It is easier to draw reliable inferences in situations where both the exposures and the population are substantial and well-defined, and accessible to direct measurement rather than recall. Thus, many important findings of carcinogenicity to humans are based on analysis of occupational exposures. Problems in interpretation of occupational epidemiological data include simultaneous exposure to several different known or suspected carcinogens, imprecise quantification of exposures and confounding exposures such as active or passive tobacco smoking. The historical database of occupational data has a bias towards healthy white adult males. Thus, the hazard analysis of these studies may not accurately characterize effects on women, infants, children or the elderly, or on members of minority ethnic groups. Nevertheless, the analysis of occupational epidemiological studies, including meta-analyses, has proved an important source for unequivocal identification of human carcinogens.

Epidemiological evidence may also be obtained where a substantial segment of a general population is exposed to the material of interest in air, drinking water or food sources. Rigorous

MV00170365

cohort and case-control studies may sometimes be possible, in which exposed individuals are identified, their exposure and morbidity or mortality evaluated, and compared to less exposed but otherwise similar controls. More often at least the initial investigation is a cross-sectional study, where prevalence of exposures and outcomes is compared in relatively unexposed and exposed populations. Such studies are hypothesis-generating, but are important sources of information nevertheless, and can often also justify more costly and labor-intensive follow-up cohort and/or case-control studies.

The clinical medical literature contains many case reports where a particular health outcome is reported along with unusual exposures that might have contributed to its occurrence. These reports typically describe a single patient or a small group, and have no statistical significance. They are nevertheless useful as indications of possible associations that deserve follow-up using epidemiological methods, and as supporting evidence, addressing the plausibility of associations measured in larger studies.

Animal studies

Although the observation of human disease in an exposed population can provide definitive hazard identification, adequate data of this type are not always available. More often, risk estimates have to be based on studies in experimental animals, and extrapolation of these results to predict human toxicity. The animals used are mostly rodents, typically the common laboratory strains of rat and mouse.

Rats and mice have many similarities to humans. Physiology and biochemistry are similar for all mammals, especially at the fundamental levels of xenobiotic metabolism, DNA replication and DNA repair that are of concern in identifying carcinogens. However, there are also several important differences between rodents and humans. Rodents, with a short life span, have differences in cell growth regulation compared to longer-lived species such as the human. For instance, whereas laboratory investigations have suggested that mutations in two regulatory genes (*e.g.* H-ras and p-53) are sometimes sufficient to convert a rodent cell to a tumorigenic state, many human cancers observed clinically have seven or eight such mutations. In addition, cultured normal human cells have a very stable karyotype, whereas cultured rodent cells facilely undergo tetraploidization and then aneuploidization in cell culture. Further, cultured human cells senesce and rarely undergo spontaneous immortalization (frequency is 10^{-7} or less), whereas cultured rodent cells facilely undergo immortalization at frequencies on the order of 10^{-3}. The use of genomics to study chemical carcinogenesis is relatively new, but the differences at present appear to be a matter of degree rather than kind.

Differences in regulation of cell division are another likely reason for variation between species in the site of action of a carcinogen, or its potency at a particular site. A finding of carcinogenesis in the mouse liver, for instance, is a reasonably good indicator of potential for carcinogenesis at some site in the human, but not usually in human liver (Huff, 1999). The mouse liver (and to a lesser extent that of the rat) is a common site of spontaneous tumors. It is also relatively sensitive to chemical carcinogenesis. The human liver is apparently more resistant to carcinogenesis; human liver tumors are unusual except when associated with additional predisposing disease, such as hepatitis B or alcoholic cirrhosis, or exposure to aflatoxin B1, or simultaneous exposure to hepatitis B virus and aflatoxin B1. Conversely, other

MV00170366

tumor sites are more sensitive in the human than in experimental animals. Interspecies variation in site and sensitivity to carcinogenesis may also arise from differences in pharmacokinetics and metabolism, especially for carcinogens where metabolic activation or detoxification is important. This variability may cause important differences in sensitivity between individuals in a diverse population such as humans. Variability between individuals in both susceptibility and pharmacokinetics or metabolism is probably less in experimental animal strains that are bred for genetic homogeneity.

Animal carcinogenesis studies are often designed to maximize the chances of detecting a positive effect, and do not necessarily mimic realistic human exposure scenarios. Thus extrapolation from an experimentally accessible route to that of interest for a risk assessment may be necessary. Even for studies by realistic routes such as oral or inhalation, doses may be large compared to those commonly encountered in the environment, in order to counter the limitation in statistical power caused by the relatively small size of an animal experiment. Whereas the exposed population of an epidemiological study might number in the thousands, a typical animal study might have fifty individuals per exposure group. With this group size any phenomenon with an incidence of less than about 5% is likely to be undetectable. Statistically significant results may be obtained even with groups as small as ten animals per dose group, when incidence of a tumor that is rare in the controls approached 100% in a treated group. The consensus experimental design for animal carcinogenesis studies, which has evolved over the last 50 years of investigation, is represented by the protocol used by the U.S. National Toxicology Program (NTP) for studies using oral routes (diet, gavage or drinking water) or inhalation. These carcinogenesis bioassays usually involve both sexes of an experimental species, and most often two species. NTP has standardized the use of the C57BlxC3H F_1 hybrid mouse, and the Fischer 344 rat as the standard test species, although NTP has announced plans to substitute use of the Wistar Han rat for the Fisher 344 rat. There is now an extensive database of background tumor incidences, normal physiology, biochemistry, histology and anatomy for these strains, which aids in the interpretation of pathological changes observed in experiments. Nevertheless, there is enough variation in background rates of common tumors that the use of concurrent controls is essential for hazard identification or dose-response assessment. "Historical control" data are mainly used to reveal anomalous outcomes in the concurrent controls. The fact that a significantly elevated incidence of a tumor relative to the concurrent control group is within the range of historical controls at that site for the test sex and strain is not necessarily grounds for dismissing the biological significance of the finding.

Groups of fifty animals of each sex and species are used, with control groups, and several dose groups, the highest receiving the maximum tolerated dose (MTD). Recent study designs have emphasized the desirability of at least three dose levels covering a decade with "logarithmic" spacing (*i.e.* MTD, 1/2 MTD or 1/3 MTD, and 1/10 MTD). This extended design is aimed at providing better dose-response information, and may contribute important additional information, such as mechanistic insights, for the hazard identification phase.

Supporting evidence: genetic toxicity, mechanistic studies

Investigators have developed additional data sources that can support or modify the conclusions of animal carcinogenesis bioassays, and provide information on mechanisms of action of agents suspected of being carcinogenic based on epidemiological studies or animal bioassays.

MV00170367

Genetic damage in exposed organisms includes both gene mutations (point or frameshift), and larger scale effects such as deletions, gene amplification, sister-chromatid exchanges, translocations and loss or duplication of segments or whole chromosomes. These genetic effects of chemical exposures are deleterious in their own right. In addition, since carcinogenesis results from somatic mutations and similar genetic alterations, agents that cause genetic damage generally have carcinogenic potential. Conversely, many known carcinogens are also known to be genotoxic, although there is also a significant class of carcinogens that are not directly genotoxic according to the usual tests. These latter agents presumably work by some other mechanism, such as methylation of tumor suppressor genes or demethylation of cellular proto-oncogenes, although recent genetic studies have shown that even tumors induced by these agents may show mutations, deletions or amplification of growth regulatory genes.

Experimental procedures to demonstrate and measure genetic toxicity may involve exposure of intact animals, and examination of genetic changes in, for example, bone marrow cells (or cells descended from these e.g. the micronucleus test, which detects remnants of chromosomal fragments in immature erythrocytes), mutations in flies (*Drosophila)*, or appearance of color spots in the coat of mice. However, many tests have employed single celled organisms or mammalian cells in culture. The best known of these tests is the *Salmonella* reverse mutation assay, popularly known as the Ames test after its inventor. This is representative of a larger class of tests for mutagenic activity in prokaryotic organisms (bacteria), which necessarily only look at gene-level mutations. Similar tests in eukaryotic microorganisms (yeasts, *Aspergillus*) and cultured mammalian cells also detect chromosomal effects. Many tests using microorganisms *in vitro* involve addition of activating enzymes (*e.g.* liver postmitochondrial supernatant – "S9") to mimic the metabolism of promutagenic chemicals *in vivo*. Another type of test examines the induction in mammalian cells of morphological transformation or anchorage-independent growth. These two chemically induced, *in vitro* changes are considered two of the many changes that fibroblastic cells must undergo on their route to neoplastic transformation (tumorigenicity). These various genetic tests contribute different information, which may be used to amplify and confirm conclusions drawn from human studies or animal bioassays, or to draw conclusions in the absence of epidemiological or bioassay data. In the latter case they have also been used in prioritizing agents for further evaluation by means of bioassays.

Carcinogen Identification schemes

Some regulatory programs, such as California's Safe Drinking Water and Toxics Enforcement Act ("Proposition 65") and various activities of the U.S. EPA, require that explicit lists of substances having the potential to act as human carcinogens be maintained. Other such lists are developed by non-regulatory research organizations, such as the U.S. National Toxicology Program and the International Agency for Research on Cancer (IARC), an international program of the World Health Organization. The California air toxics programs do not have any statutory requirement to "identify" carcinogens. The requirement instead is to identify hazardous substances as Toxic Air Contaminants, and to determine whether or not a threshold concentration, below which no adverse effects are expected, is likely to exist:

HEALTH AND SAFETY CODE, Division 26 (Air Resources), § 39660.

MV00170368

(2) The evaluation shall also contain an estimate of the levels of exposure that may cause or contribute to adverse health effects. If it can be established that a threshold of adverse health effects exists, the estimate shall include both of the following factors:

(A) The exposure level below which no adverse health effects are anticipated.

(B) An ample margin of safety that accounts for the variable effects that heterogeneous human populations exposed to the substance under evaluation may experience, the uncertainties associated with the applicability of the data to human beings, and the completeness and quality of the information available on potential human exposure to the substance. In cases in which there is no threshold of significant adverse health effects, the office shall determine the range of risk to humans resulting from current or anticipated exposure to the substance.

In practice however this requirement amounts to the need to establish whether or not a substance is carcinogenic. Any such effects are clearly harmful. Whereas the great majority of non-cancer health effects of chemicals are regarded as having a threshold, the default assumption for carcinogens is that there is no threshold (as described below). OEHHA follows the guidelines laid out by IARC for identification and classification of potential human carcinogens, which are described in detail in the most recent revision of the *Preamble* to the IARC monographs series (IARC, 2006). The IARC Monograph series provides evaluations of the carcinogenicity of individual substances or commonly occurring mixtures. The evaluation guidelines used are similar to those used by other scientific or regulatory authorities, including U.S.EPA.

The data inputs to hazard identification for carcinogens are human epidemiological studies, animal bioassays, along with supporting evidence such as mechanistic and genotoxicity data and structure-activity comparisons. IARC also assembles data on the structure and identity of the agent. The list of agents considered includes specific chemicals and also complex mixtures, occupational and lifestyle factors, physical and biological agents, and other potentially carcinogenic exposures.

IARC evaluations determine the quality of evidence for both animal and human evidence as falling into one of four categories: sufficient evidence of carcinogenicity, limited evidence of carcinogenicity, inadequate evidence of carcinogenicity and evidence suggesting lack of carcinogenicity. Stringent requirements for data quality are imposed. In view of their crucial importance, these definitions are quoted directly from the *Preamble* (IARC 2006):

"(a) Carcinogenicity in humans

Sufficient evidence of carcinogenicity: The Working Group considers that a causal relationship has been established between exposure to the agent and human cancer. That is, a positive relationship has been observed between the exposure and cancer in studies in which chance, bias and confounding could be ruled out with reasonable confidence. A statement that there is *sufficient evidence* is followed by a separate sentence that identifies the target organ(s) or tissue(s) where an increased risk of cancer was observed in humans. Identification of a specific target organ or tissue does not preclude the possibility that the agent may cause cancer at other sites.

MV00170369

***Limited evidence of carcinogenicity*:** A positive association has been observed between exposure to the agent and cancer for which a causal interpretation is considered by the Working Group to be credible, but chance, bias or confounding could not be ruled out with reasonable confidence.

Inadequate evidence of carcinogenicity: The available studies are of insufficient quality, consistency or statistical power to permit a conclusion regarding the presence or absence of a causal association between exposure and cancer, or no data on cancer in humans are available.

Evidence suggesting lack of carcinogenicity: There are several adequate studies covering the full range of levels of exposure that humans are known to encounter, which are mutually consistent in not showing a positive association between exposure to the agent and any studied cancer at any observed level of exposure. The results from these studies alone or combined should have narrow confidence intervals with an upper limit close to the null value (e.g. a relative risk of 1.0). Bias and confounding should be ruled out with reasonable confidence, and the studies should have an adequate length of follow-up. A conclusion of *evidence suggesting lack of carcinogenicity* is inevitably limited to the cancer sites, conditions and levels of exposure, and length of observation covered by the available studies. In addition, the possibility of a very small risk at the levels of exposure studied can never be excluded.

(b) Carcinogenicity in experimental animals

Carcinogenicity in experimental animals can be evaluated using conventional bioassays, bioassays that employ genetically modified animals, and other in-vivo bioassays that focus on one or more of the critical stages of carcinogenesis. In the absence of data from conventional long-term bioassays or from assays with neoplasia as the end-point, consistently positive results in several models that address several stages in the multistage process of carcinogenesis should be considered in evaluating the degree of evidence of carcinogenicity in experimental animals.

The evidence relevant to carcinogenicity in experimental animals is classified into one of the following categories:

***Sufficient evidence of carcinogenicity*:** The Working Group considers that a causal relationship has been established between the agent and an increased incidence of malignant neoplasms or of an appropriate combination of benign and malignant neoplasms in (a) two or more species of animals or (b) two or more independent studies in one species carried out at different times or in different laboratories or under different protocols. An increased incidence of tumours in both sexes of a single species in a well-conducted study, ideally conducted under Good Laboratory Practices, can also provide *sufficient evidence*.

A single study in one species and sex might be considered to provide *sufficient evidence of carcinogenicity* when malignant neoplasms occur to an unusual degree with regard to incidence, site, type of tumour or age at onset, or when there are strong findings of tumours at multiple sites.

***Limited evidence of carcinogenicity*:** The data suggest a carcinogenic effect but are limited for making a definitive evaluation because, e.g. (a) the evidence of carcinogenicity is

MV00170370

restricted to a single experiment; (b) there are unresolved questions regarding the adequacy of the design, conduct or interpretation of the studies; (c) the agent increases the incidence only of benign neoplasms or lesions of uncertain neoplastic potential; or (d) the evidence of carcinogenicity is restricted to studies that demonstrate only promoting activity in a narrow range of tissues or organs.

***Inadequate evidence of carcinogenicity*:** The studies cannot be interpreted as showing either the presence or absence of a carcinogenic effect because of major qualitative or quantitative limitations, or no data on cancer in experimental animals are available.

***Evidence suggesting lack of carcinogenicity*:** Adequate studies involving at least two species are available which show that, within the limits of the tests used, the agent is not carcinogenic. A conclusion of *evidence suggesting lack of carcinogenicity* is inevitably limited to the species, tumour sites, age at exposure, and conditions and levels of exposure studied."

IARC utilizes the evaluations of animal and human data, along with supporting evidence including genotoxicity, structure-activity relationships, and identified mechanisms, to reach an overall evaluation of the potential for carcinogenicity in humans. The revised *Preamble* (IARC, 2006) includes a description of the data evaluation criteria for this supporting evidence, and indications as to the situations where the availability of supporting evidence may be used to modify the overall conclusion from that which would be reached on the basis of bioassay and/or epidemiological evidence alone. The overall evaluation is expressed as a numerical grouping, the categories of which are described below, as before by directly quoting IARC (2006):

"Group 1: The agent is *carcinogenic to humans*.

This category is used when there is *sufficient evidence of carcinogenicity* in humans. Exceptionally, an agent may be placed in this category when evidence of carcinogenicity in humans is less than *sufficient* but there is *sufficient evidence of carcinogenicity* in experimental animals and strong evidence in exposed humans that the agent acts through a relevant mechanism of carcinogenicity.

Group 2.

This category includes agents for which, at one extreme, the degree of evidence of carcinogenicity in humans is almost *sufficient*, as well as those for which, at the other extreme, there are no human data but for which there is evidence of carcinogenicity in experimental animals. Agents are assigned to either Group 2A (*probably carcinogenic to humans*) or Group 2B (*possibly carcinogenic to humans*) on the basis of epidemiological and experimental evidence of carcinogenicity and mechanistic and other relevant data. The terms *probably carcinogenic* and *possibly carcinogenic* have no quantitative significance and are used simply as descriptors of different levels of evidence of human carcinogenicity, with *probably carcinogenic* signifying a higher level of evidence than *possibly carcinogenic*.

Group 2A: The agent is *probably carcinogenic to humans*.

MV00170371

This category is used when there is *limited evidence of carcinogenicity* in humans and *sufficient evidence of carcinogenicity* in experimental animals. In some cases, an agent may be classified in this category when there is *inadequate evidence of carcinogenicity* in humans and *sufficient evidence of carcinogenicity* in experimental animals and strong evidence that the carcinogenesis is mediated by a mechanism that also operates in humans. Exceptionally, an agent may be classified in this category solely on the basis of *limited evidence of carcinogenicity* in humans. An agent may be assigned to this category if it clearly belongs, based on mechanistic considerations, to a class of agents for which one or more members have been classified in Group 1 or Group 2A.

Group 2B: The agent is *possibly carcinogenic to humans.*

This category is used for agents for which there is *limited evidence of carcinogenicity* in humans and less than *sufficient evidence of carcinogenicity* in experimental animals. It may also be used when there is *inadequate evidence of carcinogenicity* in humans but there is *sufficient evidence of carcinogenicity* in experimental animals. In some instances, an agent for which there is *inadequate evidence of carcinogenicity* in humans and less than *sufficient evidence of carcinogenicity* in experimental animals together with supporting evidence from mechanistic and other relevant data may be placed in this group. An agent may be classified in this category solely on the basis of strong evidence from mechanistic and other relevant data.

Group 3: The agent is *not classifiable as to its carcinogenicity to humans.*

This category is used most commonly for agents for which the evidence of carcinogenicity is *inadequate* in humans and *inadequate* or *limited* in experimental animals.

Exceptionally, agents for which the evidence of carcinogenicity is *inadequate* in humans but *sufficient* in experimental animals may be placed in this category when there is strong evidence that the mechanism of carcinogenicity in experimental animals does not operate in humans.

Agents that do not fall into any other group are also placed in this category.

An evaluation in Group 3 is not a determination of non-carcinogenicity or overall safety. It often means that further research is needed, especially when exposures are widespread or the cancer data are consistent with differing interpretations.

Group 4: The agent is *probably not carcinogenic to humans.*

This category is used for agents for which there is *evidence suggesting lack of carcinogenicity* in humans and in experimental animals. In some instances, agents for which there is *inadequate evidence of carcinogenicity* in humans but *evidence suggesting lack of carcinogenicity* in experimental animals, consistently and strongly supported by a broad range of mechanistic and other relevant data, may be classified in this group."

MV00170372

The IARC hazard evaluation system provides a detailed and generally accepted scheme to classify the strength of evidence as to the possible human carcinogenicity of chemicals and other agents. This includes careful consideration of mechanistic data and other supporting evidence, the evaluation of which is also important to inform selection of models or defaults used in dose response assessment, as is described below. The extended consideration of supporting evidence is in fact the primary difference between more recent versions of the guidance from IARC, and also by other organizations including U.S. EPA, and the original versions of that guidance. In fact, the basic criteria for hazard identification based on bioassay and epidemiological data have not changed substantially in other respects from earlier guidance documents, including that originally published by California (DHS, 1985). Although as noted earlier the California Air Toxics programs do not categorize identified carcinogens, it has generally been the practice to regard any agent with an IARC overall classification in Group 1 or Group 2 as a known or potential human carcinogen. This implies the selection of various policy-based default options, including absence of a threshold in the dose-response curve, unless specific data are available to indicate otherwise. The same basic identification criteria are used by OEHHA scientific staff to determine the appropriate treatment of agents not evaluated by IARC, or for which newer data or revised interpretations suggest that an earlier IARC determination is no longer appropriate.

U.S. EPA has also proposed a scheme for carcinogen hazard identification and strength of evidence classification in their recently finalized Guidelines for Carcinogen Risk Assessment (U.S. EPA, 2005). These principally differ from the IARC guidance in recommending a more extensive narrative description rather than simply a numerical identifier for the identified level of evidence, and also to some degree in the weight accorded to various types of supporting evidence. However, for most purposes they may be regarded as broadly equivalent to the scheme used by IARC, and OEHHA has chosen to cite the IARC (2006) *Preamble* as representing the most up-to-date and generally accepted guidance on this issue.

Dose Response Assessment

The dose-response phase of a cancer risk assessment aims to characterize the relationship between an applied dose of a carcinogen and the risk of tumor appearance in a human. This is usually expressed as a cancer slope factor [“potency” – in units of reciprocal dose - usually $(\text{mg/kg-body weight.day})^{-1}$ or “unit risk” – reciprocal air concentration – usually $(\mu g/m^3)^{-1}$] for the lifetime tumor risk associated with lifetime continuous exposure to the carcinogen at low doses. Cancer potency factors may also be referred to as “cancer slope factors”. (As will be described later, additional algorithms may need to be applied to determine risk for specific age groups, or at higher doses where toxicokinetic factors have significant effect.) The basic methodologies recommended in this document are similar to those described by U.S. EPA (2005a) in their Carcinogen Risk Assessment Guidelines. This document therefore refers to U.S. EPA (2005a) for explanation of detailed procedures, and will provide only a brief summary except in cases where OEHHA recommendations are different from or more explicit than those of U.S. EPA.

The following descriptions of methods for dose response assessment, and considerations in their application, apply in principle to the analysis of both animal and human (epidemiological) cancer incidence data. Indeed, the original formulation of the multistage model (Armitage and Doll, 1954) described below was developed based on human cancer incidence. Nevertheless, the

MV00170373

number and quality of human cancer incidence datasets is limited. The more complex analyses have usually only been possible for animal experimental data, where the interindividual variability and the exposure conditions can be both measured and controlled. Most commonly, epidemiological studies have necessarily used a form of multivariate analysis to separate the effects of several different variables relating to exposure, demographics and behaviors (e.g. smoking). In these analyses it is usually assumed that the effect measure(s) vary linearly with the exposure: any more complex variance assumptions might exceed the power of the data to determine the required model parameters. However, there are exceptions, especially for occupational studies where the critical exposure is measured as a continuous variable (rather than just categorical) and where the effect of this exposure is substantial relative to other confounding factors. For example, OEHHA (1998) used a multistage model dealing with both exposure intensity and duration in the analysis of cancer incidence in railroad workers exposure to diesel exhaust (Garshick et al., 1988)

Interspecies Extrapolation

The procedures used to extrapolate low-dose human cancer risk from epidemiological or animal carcinogenicity data are generally health-protective in that they determine an upper confidence bound on the risk experienced by an exposed population. As statistical estimates they cannot be regarded as definite predictions of the risk faced by any one specific individual, who might for a variety of reasons, including individual exposure and susceptibility, experience a risk different from the estimate. The risk assessment procedures used aim to include the majority of variability in the general human population within the confidence bound of the estimate, although the possibility that some individuals might experience either lower or even no risk, or a considerably higher risk, cannot be excluded. Additionally, differences may exist between the characteristics of the general public and those of studied populations. For example, healthy workers, the subject of most epidemiological studies, are often found to have lower rates of morbidity and mortality than the general population (Wen et al., 1983; Monson, 1986; Rothman and Greenland, 1998). Most human data are derived from studies of largely male adult workers and risk estimates cannot take into account specific physiological factors of women, children, and older populations that may affect the potency of a carcinogen, including early age-at-exposure.

Dose-response assessment based on environmental epidemiological studies may involve evaluation of health impacts at exposure levels within the range of those measured in the study population. However, more usually the source data are studies of occupationally exposed humans or of animals, in which case the exposures in the study are likely to be much higher than those of concern for risk assessments relating to community or ambient exposures. Further, even when extrapolation from animal species to humans is not required, the general population to which the URF is applied may differ in characteristics relative to the occupational population studied. It is therefore necessary to extrapolate from the available data to the population and exposure range of concern, which is done by using a dose-response model derived from the source data. The models used fall into three main classes; mechanistically based models, empirical models and (where data are lacking to support a true data-based model) default assumptions. The factors affecting the dose-response relationships for carcinogenesis may also be divided into those relating to absorption, distribution, metabolism and excretion on the one hand (*i.e.* toxicokinetics), and those relating to the underlying dose-response characteristics of carcinogenesis at the tissue or cellular level (*i.e.* toxicodynamics). In this sense the problem of

MV00170374

dose response assessment for carcinogens is similar to that for non-cancer toxic effects. The toxicokinetic models used may in fact be similar for both situations, but the toxicodynamic models are generally different.

Intraspecies Extrapolation and Inter-individual Variability

In estimating the impact of a particular level of exposure to a carcinogen on a target human population, it is necessary to consider the range of susceptibility in the target population. In the present case this is typically defined as the general population of the State of California, including of course women (some of whom are pregnant), infants and children, the elderly, the sick, and those with genetic polymorphisms or acquired differences which affect their susceptibility to carcinogens. In general it has been assumed that the upper-bound risk estimates obtained from the standard toxicodynamic models described below are sufficiently health-protective to cover the intrinsic variability of the adult human target population, in spite of the fact that these models do not explicitly address this type of variability, except in the few cases where an estimate is based on epidemiological data from a large and unselected study group (U.S. EPA, 2005a). However, various analyses (Drew et al., 1983; Barton et al., 2005; Appendix J) have suggested that this assumption is inadequate to cover the expected variability within a human population that includes infants and children. Accordingly both U.S. EPA (2005b) and this document ~~(page 30 *et seq.*)~~ now offer guidance on the use of age-specific adjustment factors to allow for the potentially greater sensitivity of infants and children to chemical carcinogenesis.

The ability to accommodate human variability with regard to the toxicokinetic factors affecting susceptibility to carcinogens varies with the level of detail used in the particular assessment. If the generic interspecies extrapolation approach based on body weight is used without any explicit toxicokinetic model then the assumption is made, as in the case of toxicodynamic variability, that the overall health-protective assumptions made are sufficient to cover the toxicokinetic variability. On the other hand if explicit models such as those referenced in the following paragraph are used, this variability may be more explicitly accommodated by using parameter values which are taken as point estimates from measured distributions of population values, or by using Monte Carlo techniques to include those distributions in the model (Bois et al., 1996; OEHHA, 1992; 2001b).

Toxicokinetic Models

Considerable literature exists showing the importance of understanding the toxicokinetics of carcinogens in understanding their mechanism of action, sites of impact and dose-response relationships. U.S. EPA (2005) in Section 3.1 refers to the importance of identifying an appropriate dose metric for the dose-response analysis. Early cancer risk assessments typically used applied dose as the dose metric, which is adequate in simple cases provided appropriate correction factors are applied for interspecies extrapolation. However, it is often observed that the uptake, metabolism and elimination of the carcinogenic substance (and/or a procarcinogen and metabolites) is non-linear, especially at the higher doses employed in experimental animal studies (Hoel *et al.*, 1983, Gaylor *et al.*, 1994). Extrapolation to lower doses where such relationships tend to linearity (Hattis, 1990) is aided by the use of toxicokinetic models. These may be relatively simple compartment models, or sophisticated "physiologically based pharmacokinetic (PBPK) models" which to a greater or lesser degree model the actual

MV00170375

biochemical and physiological events of toxicokinetic importance. Applications of both types of model may be found in various risk assessment documents prepared for the Toxic Air Contaminants program (and other OEHHA risk assessments). Since the details vary widely according to the nature of the chemical and the availability of appropriate kinetic data these general guidelines will defer to those examples rather than attempt a fuller exposition here. Further analysis of the use of toxicokinetic modeling in extrapolation from animals to humans, and in accounting for interindividual variability among adult humans, infants and children is presented in the Air Toxics Hot Spots *Technical Support Document for the Derivation of Noncancer Reference Exposure Levels* (OEHHA, ~~2007: Public Review Draft~~2008). Although this refers to the use of toxicokinetic modeling in non-cancer risk assessment, the primary considerations are similar for cancer risk assessment.

Toxicodynamic Models

An early use of mechanistic analysis to support risk assessment was the development of the Armitage-Doll multistage model of dose-response for carcinogenesis. The multistage model was initially developed on theoretical grounds, and by examination of epidemiological and animal data on time to tumor incidence. Subsequent discovery of the molecular biology of proto-oncogenes has provided a basis for explaining the model in terms of actual biological events and systems (Barrett and Wiseman, 1987). This model was developed by Crump and others into the "linearized multistage model", which has been extensively used for carcinogen risk assessment. It leads to a number of partially verifiable predictions, including linearity of the dose-response relationship at low doses, which is observed for many genotoxic carcinogens. It also predicts the form of the dose-response relationship at higher doses, which generally follow a polynomial form (subject to sampling and background corrections) except where other identifiable factors such as pharmacokinetics intervene.

It has been argued that the simple linearized form of the multistage model has limitations as a description of carcinogenic mechanisms, which detract from its usefulness and generality. Cell proliferation is known to be important in the progression of cancer. It may actually be the primary mechanism of action for a few carcinogens, as opposed to the direct modification of DNA by the carcinogen or a metabolite which is assumed to cause the mutational event at each stage in the original multistage description. A cell proliferation model has been developed (Moolgavkar and Knudson, 1981), which retains the concept of an initiating mutational event (in most cases caused by interaction of the chemical with DNA, although it could also be a spontaneous mutation) as in the original multistage model, but also considers proliferation, death or terminal differentiation of both normal and initiated cells. This model is thought to better describe the biological events in carcinogenesis. However, it has not been used extensively in risk assessment because it requires many parameters that are difficult to define and measure (such as proliferation and death rates for various classes of cell). If these cannot be accurately determined, the model has too many free parameters and is not helpful in defining extrapolated values for risk assessment purposes. This highlights a general problem in using mechanistic models in carcinogen risk assessment, which is that the carcinogenesis data themselves are generally insufficient to define fully the dose response curve shape at low doses or provide much mechanistic information. The analysis is therefore supplemented with policy-based assumptions (such as the expectation of linearity at low doses) and, wherever possible, additional

MV00170376

experimental measurements relating to the mechanism of action, in order to make meaningful prediction of risk from environmental exposures to humans.

Because of the difficulties in validating simplified mechanistic models such as the basic multistage model, and the additional difficulty of parameter estimation with more complex mechanistic models, the new U.S. EPA guidelines (U.S. EPA, 2005a) and some recent California risk assessments have chosen instead to use a less overtly mechanistic approach. This approach combines benchmark dose methodology (described below) with an explicit choice of the method for low-dose extrapolation, either assuming low-dose linearity or, for certain carcinogens where data indicate that this is appropriate, a "margin of exposure" or safety/uncertainty factor based approach. This benchmark method is now normally recommended for carcinogen dose response analysis, and the results generally differ little from those derived by the linearized multistage model. Although the linearized multistage method is no longer recommended as the default approach for cancer potency estimation it remains a plausible alternative in many cases, and still has useful applications, such as for time-to-tumor analyses for which benchmark methods are not yet widely available. Additionally, a considerable number of existing cancer potencies in Appendices A and B, and used in the Air Toxics Hot Spots program were derived by this method. Many of these would not be significantly different if calculated by the benchmark approach, and are unlikely to be replaced soon by newly calculated values. The linearized multistage method will therefore also be briefly described here.

Benchmark dose methodologies

The use of benchmark dose methodology has been explored by various investigators [including Gaylor et al. (1998); van Landingham et al. (2001) and Crump (1984, 1995, 2002)] as a tool for dose response extrapolation. This has been recommended in regulatory guidelines for both carcinogenic (U.S. EPA, 2005a) and non-carcinogenic (U.S. EPA, 1995) endpoints. The basic approach is to fit an arbitrary function to the observed incidence data, and to select a "point of departure" (POD) (benchmark dose) *within the range of the observed data.* From this a low dose risk estimate or assumed safe level may be obtained by extrapolation, using an assumed function (usually linear) or by application of uncertainty factors. The critical issue here is that no assumptions are made about the nature of the underlying process in fitting the data. The assumptions about the shape of the dose response curve (linear, threshold, etc.) are explicitly confined to the second step of the estimation process, and are chosen on the basis of policy, mechanistic evidence or other supporting considerations. The benchmark chosen is a point at the low end of the observable dose-response curve. Usually a dose at which the incidence of the tumor is 10% is chosen for animal studies, although lower effect levels may be appropriate for large epidemiological data sets. Because real experimental data include variability in the response of individual subjects, and measurement errors, likelihood methodology is applied in fitting the data. A lower confidence bound (usually 95%) of the effective dose (LED_{10}), rather than its maximum likelihood estimate (MLE), is used as the point of departure. This properly reflects the uncertainty in the estimate, taking a cautious interpretation of highly variable or error-prone data. It also reflects the instability of MLE values from complex curve-fitting routines, which has been recognized as a problem also with the linearized multistage model.

For cancer dose-response estimation using the benchmark dose method, either animal bioassay data or epidemiological data provide a suitable basis. In the absence of a pharmacokinetic model

MV00170377

(which could provide tissue-specific dose metrics), the potency would ordinarily be based on the time-weighted average exposure during the exposure or dosing period. The model used to fit the data can be chosen from a range of available alternative quantal models, depending on which provides the best fit to the data in the observable range. In practice, the multistage polynomial fit developed for the linearized multistage model works well for most tumor data sets. Here it is being used merely as a mathematical curve-fitting tool, where the model well fits the data set, without making assumptions about its validity as a biological model of carcinogenesis.

Suitable polynomial fits and estimates of the benchmark may be obtained using U.S. EPA's BMDS software. The benchmark often used is the 95% lower confidence bound on the dose producing 10% tumor incidence. However, if data are available which include a significant dose-response at less than 10% tumor incidence, then that lower benchmark should be used (e.g. LED_{05} or LED_{01}). Other software such as Tox_Risk, which was used for the linearized multistage model, has been used successfully, although the earlier GLOBAL program and its relatives are less suitable as curve-fitting tools for benchmark dose analysis.

Since it is usually assumed in cancer risk estimation that the low-dose response relationship is linear, risk estimates and a potency value (slope factor) may be obtained by linear extrapolation from an appropriate benchmark dose. The potency is the slope of that line ($0.1/LED_{10}$). The low dose linearity assumption is a general default for any carcinogen, and it is unlikely to be altered for genotoxic carcinogens.

A calculation using the benchmark dose approach (using a polynomial model with exponents restricted to zero or positive values), and linear extrapolation from the LED_{10} to obtain a potency estimate is shown in Figure 1 (the figure was generated by the U.S. EPA's BMDS program). This is based on tumor incidence data from an actual experiment with vinyl bromide in rats (Benya *et al.*, 1982), with metabolized dose calculated by means of a pharmacokinetic model (Salmon *et al.,* 1992). The value of q_1* obtained by this calculation would then be corrected for the duration of the experiment if it had lasted for less than the standard rat lifetime, and for bodyweight and route-specific pharmacokinetic factors as described below. This is in addition to the correction for exposure duration that would be necessary if the study had not lasted for 105 weeks, and the interspecies correction, both of which are described below.

MV00170378

Linearized Multistage Model

Quantal analyses

A "multistage" polynomial (U.S. EPA, 1986, 2005a; Anderson *et al.*, 1983), based on the mechanistic insights of the original Armitage and Doll model of cancer induction and progression, has been used extensively by U.S. EPA, OEHHA and other risk assessors to model the dose response for lifetime risk of cancer. It usually is used for analysis of animal bioassay data, although related approaches have occasionally been used with epidemiological data. In mathematical terms, the probability of dying with a tumor (P) induced by an average daily dose (d) is:

$$P(d) = 1 - \exp[-(q_0 + q_1 d + q_2 d^2 + \ldots + q_j d^j)]$$

with constraints

$$q_i \geq 0 \text{ for all i.}$$

MV00170379

Equivalently, $A(d) = 1 - \exp[-(q_1 d + q_2 d^2 + \cdots + q_k d^k)]$,

where $A(d) = \dfrac{P(d) - P(0)}{1 - P(0)}$ is the extra risk over background at dose d.

The q_i model parameters are constants that can be estimated by fitting the polynomial to the data from the bioassay, *i.e.* the number of tumor bearing animals (as a fraction of the total at risk) at each dose level, including the controls. The fit is optimized using likelihood methodology, assuming that the deviations from expected values follow a χ^2 distribution, with the number of degrees of freedom (and hence the maximum number of terms allowed in the polynomial) determined by the number of points in the data set. All the coefficients of the terms are constrained to be zero or positive, so the curve is required to be straight or upward curving, with no maxima, minima or other points of inflection. In addition to the maximum likelihood estimates of the parameters, the upper 95% confidence ~~bounds~~ limits on these parameters are calculated.

The parameter q_0 represents the background lifetime incidence of the tumor. The 95% upper confidence limit of the slope factor q_1~~, or more usually its upper bound~~ (q_1^*), is termed the cancer potency. The maximum likelihood estimate (MLE) of q_1 is not usually regarded as a reliable estimate for several reasons. First, it fails to reflect the uncertainty and variability in the data which affect the value of the estimate. This is an important issue for protection of public health, which is emphasized by current regulatory guidelines. Secondly, due to the variable order of the polynomial and the effect of some terms being zero as opposed to having a small but finite value, the MLE is unstable, and may show large and unpredictable changes in response to very slight changes in the input data. It may also erratically have a zero value, even when the data imply a significant positive dose-response relationship. The MLE is not a measure of central tendency for this estimate distribution (which is always asymmetrical and often multi-peaked). For small doses, the cancer potency is the ratio of excess lifetime cancer risk to the average daily dose received. Details of the estimation procedure are given in Crump (1981) and Crump, Guess, and Deal (1977). Several software programs are available to perform the necessary calculations, including U.S. EPA's BMDS, Tox_Risk and the earlier GLOBAL programs by Crump and colleagues, and Mstage, written by Crouch (1987).

When dose is expressed in units of mg/kg-d, the potency is given in units of $(\text{mg/kg-d})^{-1}$. Likewise, when the model input is in units of concentration ($\mu g/m^3$, ppb), the potency is given in units of $\mu g/m^3)^{-1}$ pr $(\text{ppb})^{-1}$. As in the case of potencies obtained by the benchmark approach, the experiment-based potency value needs to be corrected for less-than lifetime or intermittent exposure, and extrapolated from the test species to humans. Risk calculations using potency value estimated using the linearized multistage model predict the cancer risk at low doses only, with the higher order terms of the fitted polynomial being ignored since their contribution is negligible at low doses.

Selection of Site and Tumor Type

In developing cancer potency estimates from animal data, standard practice has been to use dose-response data for the most sensitive tumor site as the basis of the estimate (CDHS, 1985). Where tumors of more than one histological type (e.g. adenomas and carcinomas) are observed at a single site, the combined incidence, i.e. proportion of animals affected with at least one tumor of

MV00170380

any of the relevant types, is used for dose-response assessment. The same rules for combining tumor types are generally applied in determining statistical significance for carcinogen identification (IARC, 2006). Tumor types considered to represent different stages of progression following initiation of a common original normal cell type are combined, whereas tumor types having different cellular origins are generally not combined by this procedure. Other considerations that may influence choice of site for dose response estimation include the quality of the data (especially, the statistical impact of a high or variable rate of a particular tumor type and site in control animals), and biological relevance to humans. However, it is an important principle that, just as for the hazard identification phase, concordance of site or tumor type between animal models and human health effects may occur but is not assumed or required.

Carcinogens inducing tumors at multiple sites

For most carcinogens, the selection of the most sensitive site in the animal studies is recognized as providing a risk estimate which is appropriate to protect human health. However, for chemicals that induce tumors at multiple sites, the single-site approach may underestimate the true carcinogenic potential. For example, the overall assessment of cancer risk from cigarette smoking (U.S. DHHS, 1982) or ionizing radiation (NRC, 1990) is not based on risk at one site, such as lung cancer. Instead, total cancer risk is estimated from all the sites at which agent-induced tumors are observed (lung, bladder, leukemia, etc), combined.

For carcinogens that induce tumors at multiple sites and/or with different cell types in a particular species and sex, OEHHA derives the animal cancer potency by probabilistically summing the potencies from the different sites and/or cell types. Using the combined potency distribution takes into account the multisite tumorigenicity and provides a basis for estimating the cumulative risk of all treatment-related tumors.

The linear term (q_1) of either the multistage model or the multistage-in-dose, Weibull-in-time model is first estimated based on the dose-response data for each of the treatment-related tumor sites. Statistical distributions, rather than point estimates, are generated at each site by tracing the profile likelihood of the linear term (q_1) (Zeise et al., 1991). The distributions of q_1 for each of the treatment-related sites are then statistically summed using a Monte Carlo approach and assuming independence (Figure 2). The sum is created by adding the linear term for each tumor site, according to its distribution, through random sampling. The upper 95 percent confidence limit on the summed distribution is taken as the multisite animal cancer potency estimate (McDonald et al., 2003, McDonald and Komulainen, 2005).

OEHHA has applied this approach in several recent dose-response analyses, including that for naphthalene presented in Appendix B of this document.

MV00170382

Early-Lifestage Cancer Potency Adjustments

In recent years, there have been growing concerns regarding the exposure of children to environmental chemicals, including the possibility that they may be more susceptible than adults to injury caused by those chemicals. The California Legislature passed the Children's Environmental Health Protection Act (Senate Bill 25, Escutia; Chapter 731, Statutes of 1999; "SB 25") to help address these concerns. Under SB25, OEHHA is mandated to consider infants and children specifically, where data permit, in evaluating the health effects of Toxic Air Contaminants (TACs).

The development of cancer is one of the adverse health effects that may occur in children as a result of exposure to environmental chemicals. The document "Prioritization of Toxic Air Contaminants under the Children's Environmental Health Protection Act" (OEHHA, 2001a) noted that risks of cancer from exposures to carcinogens occurring from conception through puberty can be different than those from exposures occurring in adulthood. Exposure to a carcinogen early in life may result in a greater lifetime risk of cancer for several reasons:

1. Cancer is a multistage process and the occurrence of the first stages in childhood increases the chance that the entire process will be completed, and a cancer produced, within an individual's lifetime.
2. Tissues undergoing rapid growth and development may be especially vulnerable to carcinogenic agents. During periods of increased cell proliferation there is rapid turnover of DNA, and more opportunity for misrepair of damage (e.g., DNA breaks, crosslinks, adducts) or alterations to result in permanent changes to the DNA (e.g., mutations, altered DNA methylation) that may ultimately lead to cancer.
3. During early development, a greater proportion of the body's cells are relatively undifferentiated stem cells, and as such represent a large target population of somatic cells capable of passing along permanent changes to the DNA during future cell divisions.
4. There may be greater sensitivity to hormonal carcinogens early in life since the development of many organ systems is under hormonal control (e.g., male and female reproductive systems, thyroid control of CNS development).
5. Other factors that may play a role in increased cancer risk from exposures during critical developmental periods include differences in immunological activity, intestinal absorption, biliary and kidney excretion, blood and fat distribution, and expression of enzyme systems that activate or detoxify carcinogens.

Data in humans and animals for a variety of carcinogens suggest that exposures to such carcinogens early in life may result in a greater lifetime risk of cancer compared to exposures later in life. Examples of this effect in humans are carcinogenicity due to ionizing radiation, diethylstilbestrol (DES), chemotherapeutic agents, and tobacco smoke.
Ionizing radiation exposure carries an increased risk of cancer when exposures occur early in life compared to adult exposures for a number of tumor types. Children exposed to ionizing radiation (diagnostic X-rays) *in utero* demonstrate a larger excess of leukemia cases than

MV00170383

children exposed to ionizing radiation postnatally (NRC, 1990). Exposure to radioisotopes (^{131}I, ^{137}Cs, ^{134}Cs, ^{90}Sr) as a consequence of the 1986 Chernobyl nuclear accident resulted in an elevated thyroid cancer incidence in children but not adults (Moysich, 2002). Treatment of children for Hodgkins lymphoma with both chemotherapeutic agents and irradiation has been shown to increase the risk of secondary tumors (Swerdlow et al., 2000; Franklin et al., 2006). Age at irradiation in Hodgkin's disease patients treated with radiotherapy strongly influenced the risk of developing breast cancer. The relative risk (RR) of developing breast cancer was 136 for women treated before 15 years of age, 19 for women 15-24 years of age, and 7 for those 24-29 years of age. In women above 30 years of age, the risk was not increased (Hancock *et al.*, 1993).

DES was administered to pregnant women in the 1940s-1960s for the purpose of preventing pregnancy loss. In 1970, Herbst and Scully described 7 cases of vaginal adenocarcinoma (6 cases of the clear-cell type) in women aged 15-22 years. This type of cancer is extremely rare in that age range. A follow-up epidemiological study included an additional case, and noted the fact that the mothers of 7 of the 8 patients had been treated with DES during their pregnancy (Herbst *et al.*, 1971). Reports by other investigators confirmed the association between maternal use of DES during pregnancy and the development of vaginal adenocarcinoma in their female offspring (Preston-Martin, 1989). It was observed that *in utero* DES exposure resulted in female genital tract morphological changes which correlated with both dose and duration of exposure, and those changes were not related to the maternal conditions which were the reason for the DES administration. Additionally, the risk of occurrence of those morphological changes declined with increasing gestational age at first exposure (O'Brien *et al.*, 1979; Preston-Martin, 1989). In contrast, vaginal adenocarcinoma incidence did not increase in the exposed mothers themselves, indicating an increased early-life susceptibility to the carcinogenic effects of DES.

There is evidence in the epidemiological literature indicating that exposure to tobacco smoke during puberty may increase risk of breast cancer later in life, particularly among women who are NAT2 slow deacetylators (Marcus *et al.*, 2000; Morabia *et al.*, 2000; Lash and Aschengrau, 1999). Wiencke et al. (1999) report that early age at initiation of smoking is associated with a higher level of DNA adducts in lung tissue of former-smokers with lung cancer.

It has also been observed by Smith *et al.* (2006) that human *in utero* or early childhood exposure to arsenic in drinking water results in significantly increased lung cancer incidences during adult life.

Data from animal studies provide additional examples of increased sensitivity to early life (typically postnatal and juvenile) exposures. These effects span a range of target tissues, including the liver (vinyl chloride, safrole), brain (methylnitrosourea), reproductive tract (DES, tamoxifen), and lung (urethane) (OEHHA, 2001a).

In the following sections we summarize two efforts to evaluate quantitatively the effect of lifestage at exposure on carcinogenic response in experimental animal studies. The first section provides a description of OEHHA's analysis of data on the effect of age at exposure on carcinogenic potency. (Details of this analysis are in Appendix J.) The second section describes U.S. EPA's work in this area. (We also provide the published paper in Appendix I that presents the U.S. EPA analyses.) Both analyses used extant data available in the published literature. U.S. EPA used their analysis to modify the procedures they have used to estimate cancer risk by

MV00170384

weighting risk by specific factors for childhood exposures. The weighting factors are a policy choice supported by U.S. EPA's data analysis. The results of OEHHA's analysis, summarized below and described in detail in Appendix J, support the decision to modify policy to weight risk when exposure occurs during childhood. Thus, OEHHA is also proposing to weight risk when exposure occurs in childhood.

OEHHA Analysis of the Effect of Age at Exposure on Cancer Potency

The analysis of animal cancer studies which include early life exposure by the Reproductive and Cancer Hazard Assessment Branch (RCHAB) of OEHHA also supports the application of lifestage-specific cancer potency factor adjustments. This analysis is provided in detail as Appendix J of this document.

Early-in-life susceptibility to carcinogens has long been recognized by the scientific community and clinicians as a public health concern. Numerous scientific publications and symposia have addressed this issue over the years and the scientific literature contains a number of human clinical findings and epidemiological studies of early life cancer susceptibility. While there are many indications of increased human cancer susceptibility in early life, the magnitude of the impact has been difficult to gauge. Until recently risk assessment procedures have not in general addressed the issue. As described in the next section, in 2005 the U.S. EPA adopted an approach to weight carcinogens by age at exposure if they act via a mutagenic mode of action. The California legislature in 2000 directed OEHHA to assess methodologies used in addressing early-in-life risk, compile animal data to evaluate those methods, and develop methods to adequately address carcinogenic exposures to the fetus, infants, and children (Children's Environmental Health Initiative [AB 2872, Shelly]; California Health and Safety Code [HSC] section 901 [a] through [e]).

OEHHA assessed cancer risk assessment methodologies, and found that the existing risk assessment approaches did not adequately address the possibility that risk from early-in-life and adult exposures may differ. OEHHA further concluded that there was a need to address early-in-life cancer risk, and undertook studies to develop methods for doing so. Age-related cancer susceptibility data were identified from published animal cancer bioassays in which these issues were addressed. Two types of studies with early-in-life exposures were compiled. The first type are "multi-lifestage exposure studies." These studies have at least two groups exposed during different lifestages: One dose group is exposed to a chemical only during one of the following lifestages (Figure 3):

prenatal (from conception to birth),

postnatal (from birth to weaning),

juvenile (from weaning to sexual maturity).

The second dose group is exposed for some period of time at an older age, preferably during the adult lifestage, that is, after sexual maturity. This group served as the reference group. In some cases where there was no adult exposure group, animals exposed as juveniles served as the reference group. Multi-lifestage exposure studies are available for many chemicals, enabling the exploration of patterns in early-life susceptibility across chemicals.

MV00170385

Figure 3. Definition of Rodent Lifestage Adopted in the OEHHA Analyses

OEHHA also conducted "chemical-specific case studies" of early-life sensitivity for two carcinogens, ethyl-N-nitrosoamine (DEN) and N-ethyl-N-nitrosourea (ENU) that combine data from a number of studies. These "chemical-specific case studies" were conducted to explore the feasibility of analyzing chemical-specific data on age susceptibility from single-lifestage exposure experiments. For these chemicals, OEHHA compiled from the literature a second type of study, "single-lifestage exposure experiments." In these experiments dose groups were exposed only during a particular lifestage and, unlike the "multi-lifestage exposure studies," there was no requirement that the same study also include groups exposed during a different lifestage. Thus, single-lifestage exposure experiments were identified as being either prenatal, postnatal, juvenile, or adult exposure studies. For each of the two chemicals, there were many prenatal studies conducted that were compiled, analyzed, and grouped together. Postnatal studies from different publications were similarly compiled, analyzed and grouped together, as were juvenile studies. Adult studies were not available for either DEN or ENU, thus for both chemicals juvenile exposure studies served as the referent for prenatal studies, and for postnatal studies.

Typical cancer bioassays such as those conducted in rats and mice by NTP involve exposing animals starting at six to eight weeks of age, which is the time at which these animals reach sexual maturity (late teenagers relative to humans). The experiments are run for two years, ending when the animal is in late middle age. Thus, early and very late life exposures are not included in the typical rodent bioassay (see Figure 4). If the NTP bioassay is used as a basis for estimating cancer potency, the potency and resulting risk estimates may be too low. Thus OEHHA focused on finding studies that evaluated early in life exposures.

MV00170386

Figure 4. Dosing Period for Typical Rodent Bioassays.

Since bioassays examining the effect of age at exposure on carcinogenesis were conducted by various investigators for different purposes, there is a great deal of variation across studies in terms of dose selection, duration of exposure, number of animals, and length of study duration. To be included in the compilation of studies with early life exposure, a study or an experimental group in a study had to meet minimum requirements.

The criteria for study inclusion are as follows:

Treated groups were exposed to a single chemical carcinogen or a single carcinogenic chemical mixture.

Study groups were not compromised by severe treatment-related non-cancer toxicity.

Overall the duration of exposure period plus observation period exceeded 40 weeks, unless animals died of tumor.

For included dose groups, the study must report age at dosing, age at sacrifice, and site-specific tumor incidence.

Each lifestage exposure treatment group has an appropriate concurrent control group, or, for rare tumors only, an appropriate historical control.

The studies were on mammals.

Each treatment and control group consists of at least ten animals, unless the conduct and design of the study was well done in all other aspects (e.g., the length of the study was sufficiently long to observe treatment-related tumors) and tumor incidence was high in treated groups and very low in controls.

Site specific tumor data were reported, not only total number of tumor bearing animals.

The test compound was administered in the diet, water, via gavage, or by intraperitoneal (i.p.), intravenous (i.v.), or subcutaneous (s.c.) injection. For dermal and subcutaneous injection studies, distal tumor findings are utilized (for dermal, other than skin tumors; for injection, non-injection site tumors).

MV00170387

While studies designed to histopathologically examine tumors at multiple sites were preferred, studies that examined only a select set of organ/tissue sites were not excluded if the sites examined were known with confidence to be the only target tissues for the chemical and lifestage in question in that particular strain of animal.

Different approaches were taken to identify animal cancer studies that included groups of animals exposed during early life stages. First, MEDLINE and TOXLINE (National Library of Medicine) databases were searched using combinations of various key words for cancer (e.g., tumor(s), neoplasm(s), cancer, neoplasia, cancerous, neoplasms-chemically induced) and for early-life exposure (e.g., age, age-at-exposure, development (al), prenatal, *in utero*, gestation (al), postnatal, neonatal, juvenile, weaning, weanling, adolescent, adolescence, young). Second, the extensive compilation of bioassays in the *Survey of Compounds which have been Tested for Carcinogenic Activity*, was reviewed. This survey, formerly maintained by the National Cancer Institute as Public Health Service Publication Number 149, or PHS 149, is now available from a private source electronically as CancerChem, 2000. Third, from bibliographies from relevant published papers additional studies were identified. Finally the Single Dose Database developed by Calabrese and Blain (1999) was obtained and utilized to identify additional publications that appeared to contain potentially useful data. All of these publications were evaluated to determine if the study dosed separate groups of animals early in life and at or near adulthood. A total of 145 publications, providing data on 84 chemicals, were identified as meeting the criteria for study inclusion. A subset of these met the criteria for inclusion in the multi-lifestage exposure analysis.

Finally, for the OEHHA multi-lifestage analyses, we define "experiment" as a study component consisting of a control group as well as a treated group(s) exposed during the same lifestage (i.e., prenatal, postnatal, juvenile or adult), and using the same experimental protocol (e.g., route of exposure, strain, species, laboratory). Thus, by our definition one publication may report multiple experiments.

In the OEHHA analysis, data from studies on 23 unique carcinogens, 20 of which are considered to act via primarily genotoxic modes of action, were analyzed. Of these 20 carcinogens, 15 are thought to require metabolic activation to the ultimate carcinogenic species (Table 1~~Table 1Table 1~~). Fourteen carcinogens, including one thought to act via primarily nongenotoxic modes of action, were included in the prenatal multi-lifestage exposure studies. Eighteen carcinogens, including two thought to act via primarily nongenotoxic modes of action, were included in the postnatal multi-lifestage exposure studies. Five carcinogens were included in the juvenile multi-lifestage exposure studies. The case study chemicals, DEN and ENU, are both genotoxic. ENU is a direct acting alkylating agent, while DEN requires metabolic activation.

MV00170388

Table 1. Carcinogens for which studies with multi-lifestage exposures in animal studies are available

Genotoxic carcinogens requiring metabolic activation
Benzidine
Benzo[a]pyrene
Dibutylnitrosamine
Diethylnitrosamine (DEN)
7,12-Dimethylbenz[a]anthracene (DMBA)
Dimethylnitrosamine (DMN)
Di-n-propylnitrosamine (DPN)
1 -Ethyl-nitrosobiuret
2-Hydroxypropylnitrosamine
3-Hydroxyxanthine
3-Methylcholanthrene (3-MC)
4-(Methylnitrosamino)-1-(3-pyridyl)-1-butanone (NNK)
Safrole
Urethane
Vinyl chloride
Genotoxic carcinogens not requiring metabolic activation
Butylnitrosourea
1,2-Dimethylhydrazine
Ethylnitrosourea (ENU)
Methylnitrosourea (MNU)
ß-Propiolactone
Nongenotoxic carcinogens
1,1-Bis(p-chlorophenol)-2,2,2-trichloroethane (DDT)
Diethylstilbestrol (DES)
2,3,7,8-Tetrachlorodibenzodioxin (TCDD)

Cancer Potency Estimation

Statistical methods were developed and used to analyze the data and derive measures of early-life susceptibility. These are described in detail in Appendix J. In brief, a cancer potency (the slope of the dose response curve) was developed for each of the experiments selected using the linearized multistage model. This model was chosen because of widespread use in risk assessment, and its flexibility in being able to fit many different data sets needed to evaluate the effect of lifestage-at-exposure on cancer potency. The dose metric used for the potency analyses is cumulative dose normalized to body weight. The cancer potency is thus expressed as the increase in tumor probability with increasing cumulative dose in units of mg/kg body weight.

MV00170389

To take into account uncertainty in potency estimation, cancer potencies are depicted by a statistical distribution, rather than by a single, fixed value, using methods described in Appendix J. While these methods have typically been used to obtain and report the 95th percentile of the cancer slope parameter for cancer risk assessment purposes, here OEHHA utilized the full distribution of the cancer slope parameter to derive measures of early-life susceptibility to carcinogens. This was done to systematically take into account uncertainty in the analysis.

For experiments where treatment related tumors were observed at multiple sites or at the same site but arising from different cell types, slopes from these sites were statistically combined by summing across the potency distributions (assuming independence across the sites that were observed) to create an overall multisite cancer potency. It is not uncommon that a carcinogen causes more than one type of cancer or causes tumors at different sites depending on lifestage at exposure. For example, in humans tobacco smoke causes cancers of the lung, bladder, and certain other organs. This multi-site carcinogenicity is frequently observed in animal experiments as well. In order to account for this, all treatment-related tumors that were observed in a given lifestage were taken into account in estimating cancer potency from that particular experiment.

Addressing Early-Age Sensitivity in Estimating Cancer Risk: Age Sensitivity Factors

Inherent Sensitivity of Lifestages – Lifestage Potency Ratios

For this analysis, OEHHA calculates the ratio of cancer potency derived from an early lifestage exposure experiment(s) to that derived from an experiment(s) conducted in adult animals. OEHHA used the potency distributions for the individual lifestage exposures, rather than a point estimate, to derive the ratios. The lifestage cancer potency ratio is then described as a distribution and one can select specific percentiles from the distribution to better understand and bound the uncertainty (Figure 5). Of particular importance is the location of the ratio distribution in relation to the reference value of 1.0, which would mean no difference in risk from exposures at early versus adult lifestages. A lifestage cancer potency ratio distribution that primarily lies above the value of 1.0 indicates early life exposures to a carcinogen result in a stronger tumor response relative to adult exposure. Conversely, a lifestage cancer potency ratio distribution that mainly lies below the value of 1.0 indicates early life exposure to a carcinogen results in a weaker tumor response relative to adult exposure.

A lifestage potency (LP) ratio distribution was derived for each multi-lifestage study, resulting in 22 prenatal ratio distributions representing 14 unique carcinogens, 55 postnatal LP ratio distributions representing 18 unique carcinogens, and seven juvenile LP ratio distributions representing five unique carcinogens. The LP ratio distributions for a given early lifestage were combined into a single "LP ratio mixture distribution," in order to show the range of susceptibilities of that lifestage to the carcinogens studied.

LP ratio mixture distributions for a given early lifestage were developed by (1) obtaining a single LP ratio distribution for each chemical (when a chemical is represented by more than one study) and then (2) equally sampling across all chemicals. When a chemical is represented by more than one study, then the LP ratio distributions from all studies of that chemical were combined by equally sampling from each LP ratio distribution via Monte Carlo methods to obtain a single

MV00170390

LP ratio distribution for that chemical. (Appendix J describes this in more detail, as well as a sensitivity analysis that included two alternative sampling methods.) Once each chemical is represented by a single LP ratio distribution, then the LP ratio mixture distribution for each early lifestage (prenatal, postnatal, and juvenile) is obtained by equally sampling across all of the chemicals via Monte Carlo methods.

Figure 5. Lifestage Potency Ratio (LPR) distribution.

Effect of longer time period for cancer to manifest

The LP ratios described above characterize the inherent susceptibility of early lifestages to carcinogen exposure, by comparing potencies for individuals followed for similar periods of time and similarly exposed, but exposed during different lifestages. Age-specific adjustments to the cancer potency must also take into account the longer period of time that carcinogen exposure to the young has to manifest as cancer. Empirical data from studies of both humans and animals demonstrate that, for many cancers, cancer risk increases with age, or time since first exposure. While some cancers have been seen to increase by as much as the sixth power of age, a general approach taken for example by the National Toxicology Program in analyzing tumor incidences in its chronic bioassays is to assume that cancer risk increases by the third power of age. Thus, consistent with the approach used by the NTP in analyzing rodent cancer bioassay data, the longer period of time that exposed young have to develop tumors is addressed by taking into account time-of-dosing. This was done by multiplying the LP ratio by a time-of-dosing factor, to yield an age sensitivity factor (ASF). Specifically, the prenatal LP ratio is multiplied by a factor of 3.0, the postnatal LP ratio is multiplied by a factor of 2.9, and the juvenile LP ratio is multiplied by 2.7. Thus, ASFs were developed for each experiment, by first calculating the LP ratio to address inherent susceptibility of early lifestages relative to adults, and then accounting for the effect of years available to manifest a tumor following carcinogen exposure. (see Figure

MV00170391

6). Note that we are not using the term "sensitivity" in the immunologic sense (e.g., sensitization), but rather are using the term more generically.

Figure 6. Issues addressed by the Age-Sensitivity Factor (ASF)

MV00170392

Application of this approach for risk associated with lifetime exposures would include an ASF of less than 1 for exposures during the latter part of adult life for carcinogens that act on early stages. Therefore, the addition of this adjustment to the younger lifestages but not to the later part of the adult period could overestimate the risk of whole-life exposures. On the other hand, the 70 year "lifetime" used in estimating lifetime cancer risk does not reflect the longer lifespan of the U.S. population. Further, as noted above, the animal bioassays on which potency was based typically exclude pre-weaning dosing and sacrifice animals during their late middle-age. Use of cancer potencies calculated from standard assays can therefore understate lifetime cancer risk. The ASF calculated for carcinogens includes both inherent sensitivity of developing animals and the available time since exposure to develop cancer.

Results of OEHHA Analysis

The analyses indicate that both the prenatal and postnatal lifestages can be, but are not always, much more susceptible to developing cancer than the adult lifestage. The analyses also indicated that the ASFs for these age windows vary by chemical, gender and species.

Regarding prenatal lifestage exposure, few cases were indicative of equal inherent adult and prenatal susceptibility, with an LP ratio of unity. The LP ratio distribution was roughly bimodal, with LP ratios for several studies significantly greater than unity and several others significantly less than unity. Figure 7 below shows the ASFs from each of the prenatal multi-lifestage exposure studies, displayed as a cumulative frequency profile. The median of the prenatal ASF mixture distribution was 2.9 (see also Table 6 in Appendix J),

The modality in the prenatal LP ratio distribution was reflected in the DEN and ENU case studies, with results for DEN suggesting inherently less sensitivity than older animals from exposure *in utero*, and for ENU just the opposite. For the DEN and ENU case studies, the referent groups were juvenile rather than adult animals, and the results may have underestimated the LP ratio and ASF, to the extent that some of the apparent sensitivity for DEN and ENU in the prenatal period carries through to the juvenile period. ENU is a direct acting carcinogen that does not require metabolic activation, whereas DEN can not be metabolized to any significant extent by fetal tissues until relatively late in gestation. This may explain the lower fetal susceptibility of DEN. However, prenatal metabolic status is not the sole determinant of prenatal susceptibility; e.g., benzidine and safrole require metabolic activation and exhibit greater susceptibility from prenatal exposure.

The median of the postnatal ASF mixture distribution was 13.5 (see Table 7 in Appendix J). Figure 8 below shows the ASFs from each of the postnatal multi-lifestage exposure studies, displayed as a cumulative frequency profile. Thus, for the chemicals studied, there was generally greater susceptibility to carcinogens during the early postnatal compared to the adult period, particularly when the ASF accounts for the longer period cancer has to manifest when exposure occurs early in life. The DEN and ENU case studies also exhibited substantial extra susceptibility during the postnatal period. To summarize, for most of the carcinogens studied here, animals are inherently more sensitive in the postnatal period, as indicated by Figure 8.

There were only five chemicals and seven studies, two of which were not independent, available to examine susceptibility in the juvenile period. The juvenile LP ratios indicated significantly greater susceptibility in this period for three independent studies, with the remaining studies consistent with equal inherent susceptibility to adult animals (see Figure 16 in Appendix J). Figure 9~~Figure 9Figure 9~~ below shows the ASFs from each of the juvenile multi-lifestage exposure studies, displayed as a cumulative frequency profile. The median of the juvenile ASF mixture distribution was 4.5 (see Table 8 in Appendix J) .

MV00170397

The studies that comprise the set of multi-lifestage exposure studies available for these analyses were not homogeneous. That is, they do not represent observations from the same distribution. Sensitivity analyses were conducted to test the robustness of the findings to different procedures for analyzing data and combining results. Of the methods used to combine the LC ratio distributions for underlying studies within each lifestage, the method of equally weighting studies within a chemical appeared to best represent the available data.

In calculating the ASF, to take into account the longer period of time for early carcinogen exposures to result in tumors, the hazard function was assumed to increase with the third power of age. This assumption is standard and has been borne out by a number of observations (Bailer and Portier, 1988) If the true rate of increase with age is greater than that, then the use of these ASFs may result in underestimates of the true sensitivity of these early life stages.

As the multi-lifestage exposure and case studies show, there appears to be considerable variability in age-at-exposure related susceptibility across carcinogens. There is also variability in age-at-exposure related susceptibility among studies of the same carcinogen. The sources of variability evident in the analyzed studies include timing of exposure within a given age window, and gender, strain, and species differences in tumor response. The set of studies identified and analyzed was not sufficiently robust to fully describe the variability quantitatively. This variability raises concerns that selection of the median (the 50th percentile) estimates may considerably underestimate effects for certain agents or population groups. Relatively large variability in humans in response to carcinogens is expected to be common (Finkel, 1995). On the other hand, the numbers of carcinogens represented in the available data are limited and may not be representative of the population of carcinogens to which we are exposed (e.g., greater than 500 on the Proposition 65 list alone). Thus, the size of the weighting factors used to weight risk by age at exposure is a policy decision.

Several of the carcinogens studied induced tumors at multiple sites in the same experiment, and at different sites, depending upon the lifestage during which exposure occurred. For these cases the combined multisite potency distribution referred to above was the basis for the lifestage comparison. This approach differs from other researchers investigating early vs. late in life differences who focused on tumor site-specific measures of carcinogenic activity (e.g., Barton *et al.*, 2005; Hattis *et al.*, 2004, 2005). OEHHA believes that use of combined multisite potency distributions provides a more complete approach for considering age specific differences in carcinogenic activity. However, the observation that early life is generally a period of increased susceptibility was similarly found using the tumor site-specific approach by these other researchers.

MV00170399

One limitation of the approach was the focus on lifestages, without attempting to describe changes in susceptibility that occur within a lifestage. Timing of carcinogen exposure within a given age window can affect the cancer outcome. For example, experiments with 1-ethyl-1-nitroso-biuret in prenatal and adult rats showed a three-fold difference in activity between groups exposed on prenatal day -10 versus prenatal day -3. In a second example, female rats exposed early in the adult period were more than three times as sensitive to the breast cancer effects of MNU as females exposed six weeks later. In general, the adult comparison groups in the multi-lifestage exposure studies were fairly young. The extent to which this may result in an overall bias of the results presented here is unclear. Also for several cases, juvenile animals were used as the later life exposure group. In these cases the ASFs are likely underestimates of the relative sensitivity of the prenatal and postnatal lifestages, compared to that of the adult lifestage.

Excluded from the analysis were early in life studies in which the period of exposure for a specific exposure group crossed multiple lifestages. An example of results from studies of this type is provided by mouse studies for two non-genotoxic carcinogens, diphenylhydantoin (Chhabra *et al.*, 1993a) and polybrominated biphenyls (PBBs) (Chhabra *et al.*, 1993b), in which exposures began prior to conception, and continued throughout the prenatal, postnatal, and post-weaning period, up to the age of eight weeks. The data demonstrate an increased sensitivity of the early life period. Some studies that crossed multiple lifestages were included in the analyses of Barton *et al.* (2005) (Appendix I), which are consistent with the general conclusions discussed above.

Selection of Default Age-Sensitivity Factors (ASF)

Selection of appropriate values to use to weight exposures that occur early in life using default ASFs for prenatal, postnatal and juvenile exposures is complicated by the limited database of chemicals and studies available for analysis, and the broad distribution of results for different chemicals as is shown in Figure 7, Figure 8, and Figure 9~~Figure 9Figure 9~~ (see also Appendix J). In view of the variability thus shown, and the considerable uncertainty in applying conclusions from this relatively small set of chemicals to the much larger number of chemicals of concern, it is probably unreasonable to specify a default ASF with greater than half-log precision (*i.e.* values of 1, 3, 10, 30 etc.). Therefore, in the absence of chemical-specific data, OEHHA ~~will~~ proposes to apply a default ASF of 10 for ages birth to 2 years, and a factor of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood. A factor of 10 for postnatal exposures falls just below the median estimate of the ASF for postnatal studies. This is also the value selected by U.S. EPA; while it is consistent with the OEHHA analysis, it may underestimate risk for some chemicals. The broad distribution of observed chemical-specific sensitivity ratios clearly indicates ~~certain number of~~that there are some chemicals for which the sensitivity ratio is much larger than 10. Further research is needed to develop criteria for identifying these cases. Similarly, a factor of 3 for juvenile exposures is consistent with the range of estimates derived from the multi-lifestage exposure studies, and falls close to the median juvenile ASF estimate. It is acknowledged that there are few data available on which to base an estimate for the juvenile period. A factor of 3 adjusts for the longer time available for cancer to manifest, but may not fully account for some inherent differences in susceptibility to cancer, for example ~~those observed~~the observed susceptibility of ~~in~~ breast tissue of pubescent girls exposed to radiation. For specific carcinogens where data indicate enhanced sensitivity during lifestages other than the immediate postnatal and juvenile periods, or demonstrate ASFs

MV00170400

different from the default ASFs, the chemical-specific data should be used in order to adequately protect public health.

The ASFs will be applied to all carcinogens, regardless of the theorized mode of action. While U.S. EPA currently intends to apply weighting factors only to those carcinogens with "a mutagenic mode of action"(U.S.EPA, 2005), OEHHA notes that there is evidence that early life is a susceptible time for carcinogens that are thought to act via non-mutagenic mode of action (DES is a prime example). Defining a mutagenic mode of action may be problematic if approached narrowly (ERG, 2008). Further, carcinogens may have multiple modes of action and one mode may predominant over other modes at different lifestages. The complexity of carcinogenesis argues against restricting the ASF to chemicals acting via a mutagenic mode of action.

Figure 10~~Figure 10Figure 10~~ provides a visual comparison of the ASF mixture distributions for the three early-life stages, prenatal, postnatal, and juvenile. In this figure, which is in log space, the policy choice for weighting factors of 10 for birth to age 2 years and 3 for the period of life from 2 to 15 years of age are indicated on the figure. ~~The x-axis represents the exponent (the figure is in log space).~~ It is apparent from this figure that weighting risk from exposures to carcinogens early in life is well-supported.

Figure 10. Prenatal, Postnatal, and Juvenile ASF Mixture Distributions and relation to default ASFs

MV00170401

OEHHA recognizes the limitations in the data and analyses presented, as discussed above. However, the analyses do provide some guidance on the extent risk may be over or underestimated by current approaches. While there is a great deal of variability across chemicals in the prenatal ASFs, the data indicate that the potency associated with prenatal carcinogen exposure is not zero. A factor of 3 is close to the median ASF, while a factor of 10 falls roughly at the 70th percentile of the prenatal ASF estimate. ~~This value~~An ASF could be applied as a default ~~ASF to the potency estimate~~ when calculating lifetime cancer risk in humans arising from carcinogen exposures that occur *in utero*. In view of the considerable variability in the data for different carcinogens and the limited database available for analysis, OEHHA is not ~~including~~ proposing the application of ~~this~~ a specific factor to cancer potency estimates for prenatal exposures as a default position in these Guidelines. However, given that the rodent is born at a stage of maturation similar to a third trimester fetus, it may be reasonable to include the third trimester in the potency weighting proposed for birth to age 2 years. T~~t~~he applicability of a cancer potency adjustment factor for prenatal exposure will be evaluated on a case-by-case basis, and may be used as evidence develops that supports such use. The consideration of prenatal exposures, including application of an appropriate susceptibility factor, would not make a large difference for risk estimates based on continuous lifetime exposures, due to the relatively short duration of gestation. However, risk estimates for short-term or intermittent exposures ~~might~~ would be ~~significantly~~ slightly increased by inclusion of the risks to the fetus during the prenatal period. Thus, risk may be underestimated when this lifestage is excluded from the analysis.

Age Bins for Application of ASFs

The choice of human ages to which the ASFs apply is based on toxicodynamic ~~information on functional maturation of major organ systems~~ and toxicokinetic considerations. Important toxicodynamic factors related to susceptibility to carcinogens include ~~and the concept that~~ the rate of cellular proliferation and differentiation, which is quite high during organ maturation ~~processes renders the tissue more susceptible to carcinogenesis~~. In addition, toxicokinetic differences by age are important, ~~as noted earlier,~~ due to impacts on detoxification and clearance of ~~xenobiotics~~carcinogens (see following section). ~~OEHHA's analysis of the influence of age-at-exposure on carcinogenesis broke the experimental rodent age bins~~data into age bins that we ~~termed "lifestages" into~~ including prenatal, "postnatal" (birth to weaning, about day 21) and "juvenile" (weaning to sexual maturation, or about day 22 to about day 49). Experiments were placed into the lifestage bins if exposure occurred at some time during the experimental rodent age bin. ~~The investigations of age at exposure and cancer potency used in OEHHA's analysis were all done with dissimilar protocols, and the windows of susceptibility are quite varied by chemical and organ system.~~

There is no simple way to compare the rodent age groups used in the OEHHA analysis of available data to equivalent age groups in humans. Complicating factors include variations in organ system structural and functional maturation both within and between species. Further, the rodent age bins were chosen by gross indicators of development namely birth, weaning and sexual maturation, not on the basis of known susceptibility to carcinogenesis. Thus, critical factors relating to carcinogen susceptibility by age are the focus of the choice of human age bins to which the ASFs of 10 and 3 apply, rather than an attempt at exact correlation of rodent lifestage bin with human age.

MV00170402

~~The investigations of age at exposure and cancer potency used in OEHHA's analysis were~~ not conducted by standardized protocol. Further, the windows of susceptibility are quite varied by chemical and organ system, even within the lifestages defined in the OEHHA analysis. ~~Additional complications in~~ This complicates choosing a default ASF and the human age bin to which it applies ~~are associated with changes in the potency by age-at-exposure that can be large for specific chemicals~~. Examples from animal studies provided in the appendix include the chemical diethylnitrosamine (DEN). The cancer potency varied over several orders of magnitude depending on when during gestation and postnatal life the exposure occurred. While the inability to metabolize DEN in early gestation influences the carcinogenicity of the compound, it is unlikely the only explanation. Benzidine and safrole also require metabolic activation but are more potent with prenatal exposure. A three-fold difference in potency between exposure on postnatal day 3 and postnatal day 10 is noted for 1-ethyl-1-nitrosobiuret in rats. There are also human examples of extensive variation of potency by age at exposure, including radiation, DES, and chemotherapeutic agents. The diversity of responses to different agents obviously underscores uncertainty in the choice of age bins to apply the default ASFs. However, the ASFs are a ***default*** to use when you have no chemical-specific data on influence of age-at-exposure on potency in order to protect public health. There will always be specific chemical examples where the ASF for either the birth-<2 yrs or 2-<16 yrs age bin is quite a bit larger or quite a bit smaller than the default.

In the following sections, we discuss our logic in ~~choosing~~proposing age bins of birth to age <2 years, and 2 to age <16 years to which the ASFs of 10 and 3 apply, respectively, and offer risk estimate results from other possible age bins.

Toxicokinetic Factors Relevant to Age Bins

Choice of the age-bins to which the default ASFs are applied is based on our understanding of the two primary drivers of age-related sensitivity to carcinogens, namely age-related toxicokinetic factors and toxicodynamic factors. In the case of toxicokinetics, the largest postnatal differences in xenobiotic metabolic capability occur between infants and adults. As noted in OEHHA (2001) and reviewed in detail elsewhere (e.g., Cresteil et al., 1998; Ginsberg et al., 2004), hepatic drug metabolism by the cytochrome p450 family of enzymes and the Phase II conjugating enzymes undergoes a maturation process during the first few years of life. The hepatic cytochrome p450 enzymes exist in fetal isoforms at birth, and progressively change to adult isoforms at a relatively early stage of postnatal development. Thus, in humans the metabolic capability towards prototypical substrates develops over the first year of life towards adult levels. Similarly, the largest differences in metabolic capability of Phase II enzymes (conjugation of xenobiotic metabolites prior to excretion) tend to be between infants and adults. Other factors such as renal capability also are most different between neonates and adults. Thus, the first 2 years of life would encompass the increased sensitivity of early life stages due to toxicokinetic differences between early life and adulthood.

Ontogeny of cytochrome P-450 Enzymes in Humans.

Cresteil (1998) describes three groups of neonatal cytochrome P450: Cyp3A7 and Cyp4A1 present in fetal liver and active on endogenous substrates; an early neonatal group including Cyp2D6 and 2E1 which surge within hours of birth; and a later developing group, Cyp3A4,

MV00170403

Cyp2Cs, and Cyp1A2. Total Cyp 3A protein, a major cytochrome p450 enzyme responsible for biotransformation of many xenobiotics, is relatively constant in neonates and adults. However, Cyp3A7 is the primary fetal form (Hakkola et al., 1998), while Cyp3A4 is the primary adult hepatic form of the 3A series. At one month there is about one-third of the Cyp3A4 activity as an adult liver (Lacroix et al., 1997; Hakkola et al., 1998). Allegaert *et al.* (2007) stated that Cyp3A4 (testosterone-6ß-hydroxylase) activity equaled or exceeded adult activity after 1 year of age. Cyp2E1, which metabolizes benzene, trichloroethylene and toluene, among others, increases gradually postnatally, reaching about one-third of adult levels by one year of age and attains adult levels by 10 years of age (Vieira et al., 1996; Cresteil, 1998). Cyp1A2, and Cyp2C9 and 2C19, the most abundant Cyp2 enzymes in adult human liver, appear in the weeks after birth, and reach 30%to 50% of adult levels at about 1 year of age (Treluyer et al., 1997; Hines and McCarver, 2002). Cyp1A1 is expressed in fetal liver where it can activate such xenobiotics as benzo[a]pyrene and aflatoxin B1 (Shimada et al., 1996), but is less important in adult liver (Hakkola et al., 1998).

Ontogeny of cytochrome P-450 Enzymes in Rodents.

Hart et al. (2009) report developmental profiles of a number of cytochrome P-450 enzymes (measured as levels of mRNA transcripts of the specific genes) in mice. They identified three groups of isoforms. Group 1 (Cyp3A16 in both sexes; Cyp3A41b in males) appeared rapidly after birth but declined to essentially zero at 15-20 days, which is the period of weaning in mice. A second group (Cyp2E1, Cyp3A11 and Cyp4A10 in both sexes; Cyp3A41b in females) also increased rapidly after birth, but reached a stable maximal level by postnatal day 5. The third group (Cyp1A2, Cyp2A4, Cyp2B10, Cyp2C29, Cyp2D22, Cyp2F2, Cyp3A13 and Cyp3A25) were expressed only at low levels until days 10 to 15, but reached high stable levels by day 20.

ElBarbry et al. (2007) examined the developmental profiles of two toxicologically significant cytochrome P-450 enzymes, Cyp1A2 and Cyp2E1 in rats. mRNA transcripts of these genes were very low postnatally, but thereafter increased to reach a peak at weaning (postnatal day 21 - 28 for rats). Immunoreactive Cyp1A2 and Cyp2E1 proteins were first detectable at postnatal day 3 and reached 50% of adult levels at weaning and adult levels at puberty. Differences in profiles between gene expression as MmRNA and appearance of specific proteins as determined by immunoassay may reflect changes in the relative importance of transcription and translation control process at various phases in development. Enzyme activities characteristic of Cyp1A2 and Cyp2E1 were found to parallel gene expression levels (ElBarbry et al., 2007) rather than immunodetectable protein levels, so there may also be issues of cross-reactivity between these two isoenzymes and others for which gene expression was not measured in these experiments.

In summary, the gene expression data in rats and mice show differences in details, but broadly resemble one another in that the main changes occur in the early postnatal period, with the major adjustments completed at or around the time of weaning, although the adult pattern may not be completely established until puberty. There do not appear to be substantive data for experimental species other than rats and mice, although the situation in humans appears similar in general outline and one may conclude that this pattern or some variant of it is a characteristic of mammalian species in general.

MV00170404

Ontogeny of Phase II enzymes

Phase II conjugating enzymes are generally less active in the neonate than the adult (Milsap and Jusko, 1994). Hence, there is concern that detoxification and elimination of chemicals is slower in infants. Expression of some of the UGT enzymes matures to adult levels in two months after birth, although glucuronidation of some drugs by the UGT1A subfamily does not reach adult levels until puberty (Levy et al., 1975; Snodgrass, 1992; McCarver and Hines, 2002). Reduced glucuronidation in neonates slows the clearance of *N*-hydroxyarylamines, phenol, and benzene metabolites. Acetylation by the N-acetyltransferases and sulfation by sulfotransferases are generally somewhat comparable to adult levels, although it varies by tissue and by specific sulfotransferase (McCarver and Hines, 2002). Glutathione (GSH) sulfotransferase (GST) is present as a fetal isoform which decreases postnatally, while GST-alpha and GST-mu increase over the first few years of life to adult levels (McCarver and Hines, 2002). Epoxide hydrolase, important in detoxifying reactive epoxide metabolites, is present in neonatal liver although at much reduced activity relative to adults (McCarver and Hines, 2002).

Clearances of drugs in infants and children *vs.* adults

Several investigators have evaluated age-related drug disposition (Renwick, 1998; Renwick et al., 2000; Ginsberg et al., 2002; Hattis et al., 2003). Renwick et al. (2000) noted higher internal doses in neonates and young infants versus adults for seven drugs that are substrates for glucuronidation, one with substrate specificity for CYP1A2, and four with substrate specificity for CYP3A4 metabolism. Ginsberg et al (2002) evaluated toxicokinetic information on 45 drugs in children and adults metabolized by different cytochrome P450 pathways, Phase II conjugations, or eliminated unchanged by the kidney. These authors noted half-lives in infants 3-9-fold longer than those of adults. It was also shown that the bulk of the elevated child/adult half-life ratios occurred primarily in the 0 to 6 month age range, and that for some compounds the clearance is actually higher in the 6 month to 2 year age grouping. In evaluating the interindividual variability by age, Hattis et al (2003) note that the largest interindividual variability occurs in the youngest children, apparently due to variability in development of critical metabolism and elimination pathways. Anderson and Holford (2008) noted that a comparison of three early-life drug clearance models (surface area, allometric ¾ power and per kilogram scaling) all demonstrated an increase in clearance over the first year of life due to the maturation of metabolic capacity.

Renal elimination depends on maturity of processes related to tubular reabsorption and secretion, and glomerular filtration rates. At birth, the glomerular filtration rate (GFR) is low (2-4 ml/min), increases in the first few days (8-20 ml/min) and slowly increases to adult values in 8-12 month old infants (Plunkett et al., 1992; Kearns et al, 2003).

Newborn and young animals have less capacity to excrete chemicals into the bile than do adult animals. A number of chemicals are excreted more slowly via bile in neonates than adult rats, including ouabain, the glucuronide conjugate of sulfobromophthalein (Klaassen, 1973), and methyl mercury (Ballatori and Clarkson, 1982), resulting in a longer half-life in neonates.

MV00170405

Toxicodynamic Factors Relevant to Age Bins

Important as the developmental changes in toxicokinetics are in determining sensitivity to carcinogens and other toxicants, it is likely that the toxicodynamic differences, i.e. intrinsic differences in susceptibility to carcinogenesis at the tissue or cellular level are even more influential. Changes in cell division rates and differentiation, which are thought to be important toxicodynamic determinants of susceptibility to carcinogenesis, peak in the first 2 years of life for most major organ systems. Cell division continues to accommodate growth throughout childhood and adolescence, extending in some cases even into the young adult period in both humans and experimental animals. Adolescence is an important period for organ cell division and differentiation for the mammary gland and reproductive organs.

As noted above, one of the key factors influencing susceptibility to carcinogenesis is believed to be cell division rate, which acts both by forcing error-prone repair which fixes DNA damage as mutated gene sequences (McLean et al, 1982) and by promoting expansion of mutated clones (Moolgavkar and Knudson, 1981). Actual cell division rates as a function of age are hard to determine for practical and (in the human case) ethical reasons. However, growth curves expressed as the proportional increment in body weight with time may be regarded as a reasonable although not perfect surrogate since for most tissues of the body cell size does not change markedly during growth. Both humans and rodents show remarkably high growth rates in infancy, which then drop steeply to a lower but still significant period during childhood. A growth spurt at the beginning of adolescence is noticeable in its absolute magnitude, especially in males, but does not approach the proportional growth rate seen in infancy. The time intervals proposed to reflect the period of highest sensitivity to carcinogenesis (birth to weaning, about 21 days in rodents, up to 24 months in humans) encompass the period of highest growth rate and thus is is assumed the highest cell division rates, as show in the following charts:

MV00170406

Data from CDC NHANES 2000:
http://www.cdc.gov/nchs/about/major/nhanes/growthcharts/datafiles.htm

MV00170407

Data from Tables A3 and A4 of Appendix J

Cell division rates in adult rodents and humans are harder to relate to growth curves since at least some tissues retain active cell division as part of their ongoing functionality and repair. In humans growth in body weight slows to essentially zero at the end of adolescence (and any later increments represent tissue specific changes such as increase in muscle or adipose tissue mass rather than overall growth). On the other hand, rodents continue to increase in body size (at a modest rate compared to that seen in earlier lifestages) throughout the adult period. However, it appears reasonable to conclude from the body weight data that an essentially adult pattern of overall cell division is established by the late adolescent period (age six weeks in rodents; 16 years in humans). This clearly does not include the marked growth and increases in cell division and physiological activities seen in the reproductive system and its accessories during puberty.

Organ development

The age intervals chosen for the ASFs are generally supported by human organ system development data. Examples of supporting data are available for the lung, brain, immune system and liver. Zeltner and Burri (1987) stated that postnatal lung development consists of an alveolar stage, which lasts to about 1-1.5 years of age, and a stage of microvascular maturation, which

MV00170408

exists from the first months after birth to the age of 2-3 years. Pinkerton and Joad (2006) describe alveolar proliferation as occurring most prominently in the 0-2 year age range, with alveolar expansion continuing in the 2-8 year age range. Ballinoti et al. (2008) demonstrated that addition of alveoli rather than expansion is a major mode of lung growth in infants and toddlers by measuring a constant carbon monoxide diffusion capacity to lung volume from 3 through 23 months of age. Kajekar (2007) also considered the 0-2 age range to be the primary period of alveolar development, although there is continued cellular proliferation resulting in lung growth and expansion up to approximately 18 years of age.

Rice and Barone (2000) note that most of the cell proliferation phase of human radial glia and neuronal growth is finished by 2 years of age, based on evidence in Bayer et al. (1993). They note further that numerous studies have shown actively proliferating brain regions are more susceptible to anti-mitotic agents than the same structures after active proliferation ceases. Peak brain growth as a percentage of body weight occurs at birth and around post-natal day (PND) 7-8 in humans and rats, respectively (Watson *et al.*, 2006). De Graaf-Peters and Hadders-Algra (2006) reviewed the ontogeny of the human central nervous system and found that a large amount of axon and dendrite sprouting and synapse formation and the major part of telencephalic myelination take place during the first year after birth. While the brain continues to remodel itself throughout life, cellular proliferation in the whole brain peaks by about one year of age and is relatively complete by age 2. Development of the blood-brain barrier (BBB) appears to continue in humans until approximately 6 months of age. Rat BBB functionality is essentially complete by approximately two weeks after birth (Watson *et al.*, 2006).

The immune system development occurs in stages primarily prenatally in primates and both pre- and post-natally in rodents (Dietert et al., 2000). Formation and expansion of hematopoetic stem cells is followed by expansion of lineage-specific stem cells, colonization of bone marrow and thymus, and maturation of cells to immunocompetence. In the primate, this is largely complete by 1 to 2 years of age (Holsapple et al., 2003), although establishment of immune memory develops throughout childhood and beyond. In the rodent, maturation to immunocompetence occurs postnatally from birth to about 30 days of age. In terms of carcinogenesis, perhaps one of the more important immune cells is the NK cell, thought to be responsible for immune surveillance and killing of circulating transformed cells. Based on immunohistochemistry, the principal cell lines including NK cells are present at gestation day 100 in the monkey and are at about 60% of adult values at birth (Holladay and Smialowicz, 2000).

As noted above, renal and hepatic clearance are both lower in humans at birth than in adults. Nephrogenesis is complete by 35 ~~month~~weeks gestation in humans and before birth in the mouse (but after birth in the rat). The ability to concentrate urine and the development of acid-base equilibrium ~~occur~~appear in the first few months after birth (Zoetis and Hurtt, 2003). Renal clearance of drugs, a function of a number of processes in the kidney, appears to be comparable to adults within the first few months of life (Hattis et al., 2003; Ginsberg et al., 2002) , while glomerular filtration, which rises rapidly over the first few postnatal months, is at adult values by two years of age (Zoetis and Hurtt, 2003). While complete anatomic maturity of the human liver is noted by 5 years of age (Walthall et al, 2005), liver function also appears to mature within the first year of life as seen by drug clearance studies cited above.

MV00170409

Critical Windows of Susceptibility to Carcinogens

It has been shown that there are critical windows during development both pre-and postnatally where enhanced susceptibility to carcinogenesis occurs (Anderson et al, 2000). Some of these observations relate to factors affecting the incidence of cancers in childhood, resulting from prenatal or preconception mutational events. For example, prenatal exposure to ionizing radiation and DES can result in leukemia and vaginal carcinoma, respectively, in childhood. Although obviously a source of great concern, these cancers appearing during childhood are relatively rare compared to cancers appearing later in life. Thus the concern in risk assessment for early in life exposures is to address the lifetime cancer incidence as a result of these exposures, including both cancers appearing during childhood and those appearing later.

OEHHA (see Appendix J) and other investigators (U.S. EPA, 2005; Barton et al, 2005; Hattis et al., 2004) have examined the available rodent data on sensitivity to carcinogenic exposures early in life. All these investigators found substantial increases in sensitivity to carcinogens in animal studies where exposures to young animals were compared to similar exposures to adults. Hattis et al. (2004) reported maximum likelihood estimates for the ratio of carcinogenic potency during the period from birth to weaning to the adult potency of between 8.7 and 10.5, whereas Barton et al (2005) reported a weighted geometric mean of 10.4 for the ratio of juvenile (less than 6-8 weeks) to adult potency in rodents. However, the number of experiments which provide information of this type, and the carcinogenic agents which have been studied, are relatively limited. Hattis examined several different datasets and study designs, but these covered only 13 different chemicals, while Barton et al. reported analyses for six of the 18 chemicals which they examined. OEHHA's analysis included data in rodents on 23 chemicals, and found median potency ratios of 13.5 for the postnatal period (birth to day 22) and 4.5 for the juvenile period (postnatal days 22 to 49) relative to adults (day 49 to 2 years). These potency ratios include the adjustment for time to manifest tumor (e.g., age to the power of three), unlike the earlier investigations. All these investigations identified variations in the observed lifetime potency ratio depending on the type of experimental design, the sex of the animals, the time of exposure and especially between chemicals. Nevertheless these analyses, although falling far short of a comprehensive evaluation of the age dependence of carcinogenic potency for all the chemicals of interest, do show a consistent overall trend of increasing potency for exposures early in life, especially soon after birth.

An evaluation of cancer induction by ionizing radiation also provides support for the concept of enhanced sensitivity to carcinogenesis at younger ages. Various studies of this phenomenon have been undertaken in animal models, but the important point for the present discussion is that epidemiological data exist which indicate age-dependent sensitivity in humans (U.S. EPA, 1994; 1999). The most extensive data set showing age-dependent effects is that for Japanese survivors of the atomic bomb explosions at Hiroshima and Nagasaki. Analysis of these data shows linear increases in tumor incidence at a number of sites with increasing radiation dose and younger age at exposure. There are other data suggesting humans are more susceptible to chemical carcinogens when exposure occurs in childhood. These data exist for tobacco smoke (Marcus et al., 2000; Wiencke et al., 1999) and chemotherapy and radiation (Mauch et al., 1996; Swerdlow et al., 2000; Franklin et al., 2006).

MV00170410

Proposed Aage bins for application of default age sensitivity factors

In developing a default science-based risk assessment policy to address this general conclusion, one key variable to define is the age interval or intervals over which age-dependent sensitivity factors should be applied. Different investigators have considered different age ranges, but in general the more sensitive period has at least been defined as including the time from birth up to mid-adolescence when the major phases of growth and hormonal change are complete. ~~This can be somewhat consistently defined in the case of laboratory rodents whose genetic and environmental factors are relatively constant: a transition point in the range of 6 to 8 weeks is generally identified as the start of adulthood. For humans there is inevitably a lot more variation in the timing of developmental landmarks. The comparison of human development with that of rodents is complicated by the fact that the various organ systems have markedly different pre-and postnatal timetables, both between species and between organ systems. Thus there is no single timeline of developmental equivalence for humans and rodents. Nevertheless there is a general similarity for all mammals.~~

It is also recognized that, apart from the dramatic prenatal developmental events, the earliest postnatal stages represent the greatest differences in physiology and biochemistry from the adult~~.~~ This reflects~~ing~~ the immaturity of many organ systems, extremely rapid growth and the incomplete maturation of various metabolic capabilities. ~~In animal studies, as reflected in the analysis of carcinogenesis by OEHHA, an important developmental milestone is generally identified at the time of weaning, which in rodents occurs at or about postnatal day 21.~~ As noted ~~earlier, the rodent age bins in OEHHA's analysis were based on gross developmental~~ milestones (birth, weaning, sexual maturity). ~~OEHHA's analysis of studies that included exposure~~ sometime between birth and weaning indicated this period as having the highest sensitivity to carcinogenesis. The data for the later juvenile period (postnatal days 22 to 49) are somewhat sparse, covering only three carcinogens and only one where there are corresponding data for both infant and juvenile lifestages. However, it appears based on the overall range of potency ratios observed for the juvenile period that sensitivity to many carcinogens is elevated in this period also, but to a lesser extent than during the first 22 days. [Hattis et al. (2005) and Barton et al. (2005) report analyses for exposures at any time during the juvenile period, i.e. up to 6-8 weeks, and do not separate by additional age bins].

Weaning is not such an obvious or consistently timed transition for humans, being subject to a wide range of cultural and economic variables. However, it is generally considered that the human infant period encompasses the first two years of life. This period includes the most rapid periods of cellular division and differentiation for the major organ systems (excluding the breast and reproductive organs). Although there is linear growth between 2 and 8 years of age, the organ development is largely although not entirely complete.

Thus, considering both the development of major organ systems and the associated differences in toxicodynamic and toxicokinetic factors, OEHHA ~~chose~~proposes to apply the postnatal ASF derived from rodent studies (birth to ~21 days) to the human age intervals of ~~1~~birth - <2years. ~~Similarly, OEHHA chose to apply the "juvenile" ASF derived from rodent studies (~22- ~49~~ days) to the human ages 2 - <16 years. This timetable was also selected by U.S. EPA (2005) in their supplemental guidance for assessing early-life susceptibility to carcinogens. They describe their choice of critical periods as follows:

MV00170411

> "The adjustments described below reflect the potential for early-life exposure to make a greater contribution to cancers appearing later in life. The 10-fold adjustment represents an approximation of the weighted geometric mean tumor incidence ratio from juvenile or adult exposures in the repeated dosing studies (see Table 8). This adjustment is applied for the first 2 years of life, when toxicokinetic and toxicodynamic differences between children and adults are greatest (Ginsberg et al., 2002; Renwick, 1998). Toxicokinetic differences from adults, which are greatest at birth, resolve by approximately 6 months to 1 year, while higher growth rates extend for longer periods. The 3-fold adjustment represents an intermediate level of adjustment that is applied after 2 years of age through <16 years of age. This upper age limit represents middle adolescence following the period of rapid developmental changes in puberty and the conclusion of growth in body height in NHANES data (Hattis et al., 2005). Efforts to map the approximate start of mouse and rat bioassays (i.e., 60 days) to equivalent ages in humans ranged from 10.6 to 15.1 years (Hattis et al., 2005)."

There is general agreement that rodents are born at a maturational stage approximately equivalent to a third trimester human fetus. Thus, there is good rationale to include the third trimester of pregnancy in the age bin for application of the ASF of 10.

While there is strong evidence that growth and therefore cell proliferation rates and cell differentiation are extremely high prior to age 2, there is still residual uncertainty with respect to the cutpoint for application of the ASFs of 10 and 3. Thus, another possible approach is to move the cut point for the application of the ASF of 10 to a later age to account for this uncertainty. We present the effect on risk estimates of varying cutpoints in Tables 2 and 3.

Special consideration of puberty

In addition to the general concerns over increased sensitivity to carcinogenesis during infancy and childhood, there are specific concerns for exposure during the period when hormonal and developmental changes associated with puberty are in process, especially for carcinogens with hormonal modes of action or with impacts on the reproductive system and its accessory organs. At puberty, there is increased development of breast and reproductive organs that clearly involves rapid cellular division and differentiation. Thus, for carcinogens that induce mammary and reproductive organ cancers, puberty represents a time of increased sensitivity. As noted in the section on Selection of Default Age-Sensitivity Factors (page 48), if the risk assessor is evaluating a chemical with the potential for more than usually enhanced potency during this period, such as those which induce mammary or reproductive organ tumors (e.g., a polycyclic aromatic hydrocarbon), then the risk assessment may use a larger ASF to calculate risk from exposure during puberty. OEHHA may recommend chemical-specific ASFs for puberty to the local air quality management districts for use in the Air Toxics Hot Spots program.

MV00170412

Application of ASFs in Risk Assessment

The effect of using the proposed default ASFs in calculating cancer risk over a 70 year lifetime, and for a 9 year exposure common in the Hot Spots program risk assessments is demonstrated in Table 2 and Table 3 below. Ignoring for the moment the increased exposures to carcinogens that children experience, the effect of the weighting factors is to increase the lifetime cancer risk by about 2. For risks from shorter exposures, such as the commonly used 9 year exposure scenario, OEHHA proposes to evaluate risk starting at age 0 in the surrounding general population. The weighting factors in this case increase the risk to a larger extent. Depending on the exposure scenario, the use of age-specific distributions for uptake rates for air, food and water would also increase the risk estimates significantly independent of any application of ASFs. This is because the uptake rates for all these media per unit of body weight are higher in children and, especially, infants.

Assessing risks to short-term exposures to carcinogens involves additional uncertainties. The cancer potency factors are generally based on long-term exposures. However, in reality, the local air districts in California are frequently assessing risk from short term activities related to construction, mitigation of contaminated soils, and so forth. OEHHA recommends that when assessing such shorter term projects, the districts assume a minimum of 2 years of exposure and apply the slope factors and the 10 fold ASF to such assessments. Exposure durations longer than 2 years would use the method for the remaining years as noted above.

MV00170413

Table 2. Example of default ASF use for a lifetime exposure (not adjusted for age-specific exposure)

Carcinogen Potency = 1 $(mg/kg\text{-}d)^{-1}$
Exposure = 0.0001 mg/kg-d
No consideration of differences of exposure

No adjustment: Lifetime Risk = potency × dose			Risk
70 year Lifetime risk = 1 × 0.0001			**1.0×10^{-4}**

With proposed default ASF of 10 for birth to age 2 and 3 for age 2 to 16 years: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (birth to age 2 yrs)	10	2/70	0.286×10^{-4}
R (age 2 to 16 yrs)	3	13/70	0.557×10^{-4}
R (age 16 to 70 yrs)	1	55/70	0.786×10^{-4}
70 year Lifetime Risk			**1.6×10^{-4}**

With proposed default ASF of 10 for third trimester to age 2 and 3 for ages 2 to 16 years: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (third trimester to age 2yrs)	10	2.25/70.25	0.320×10^{-4}
R (age 2 to age 16 yrs)	3	13/70.25	0.555×10^{-4}
R (age 16 to 70 yrs)	1	55/70.25	0.783×10^{-4}
70 year Lifetime Risk			**1.66×10^{-4}**

With proposed default ASF of 10 for birth to age 5 and 3 for the ages 5 to 16 years: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (birth to age 5)	10	4/70	0.571×10^{-4}
R (age 5 to 16 yrs)	3	11/70	0.471×10^{-4}
R (age 16 to 70 yrs)	1	55/70	0.786×10^{-4}
70 year Lifetime Risk			**1.8×10^{-4}**

MV00170414

Table 3. Example of default ASF use for a 9-year exposure

Carcinogen Potency = 1 $(mg/kg\text{-}d)^{-1}$
Exposure = 0.0001 mg/kg-d
No consideration of differences of exposure

No adjustment: Total Risk = potency × dose x fraction of lifetime		Duration	Risk
9-year Total Risk		9/70	**0.13×10^{-4}**
With default ASF of 10 for birth to age 2, and 3 thereafter: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (birth to age 2 yrs)	10	2/70	0.286×10^{-4}
R (age 3 to 9 yrs)	3	7/70	0.300×10^{-4}
9 year Total Risk			**0.59×10^{-4}**
With default ASF of 10 for third trimester to age 2 and 3 thereafter: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (third trimester to age 2yrs)	10	2.25/70.25	0.325×10^{-4}
R (age 2 to 9 yrs)	3	7/70.25	0.300×10^{-4}
9 year Total Risk			**0.625×10^{-4}**
With default ASF of 10 to age 5 and 3 thereafter: LR = Σ (potency x dose x ASF x fraction of lifetime)	ASF	Duration	Risk
R (birth to age 5 yrs)	10	4/70	0.571×10^{-4}
R (age 5 to 9 yrs)	3	5/70	0.214×10^{-4}
9 year Total Risk			**0.785×10^{-4}**

U.S.EPA Analysis of the Effect of Age at Exposure on Cancer Potency

U.S. EPA addressed the potential for increased susceptibility to cancer caused by environmental chemicals when the exposure occurs during an early lifestage in "Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens" (U.S. EPA, 2005b) (referred to henceforth as the Supplemental Guidance). This document is intended to be a companion to the revised "Guidelines for Carcinogen Risk Assessment" (U.S. EPA, 2005a). We present a summary of their analysis, which support the policy decision to weight cancer potency and therefore risk by age-at-exposure. As previously noted, there are several methodological differences between the U.S. EPA analysis and the OEHHA analysis. Of note, in the OEHHA analysis all treatment-related tumors that were observed in a given lifestage exposure experiment were taken into account in estimating cancer potency. Thus in comparing cancer potencies

MV00170415

associated with early life vs. adult exposure, OEHHA compared the total cancer risk associated with exposure during a given lifestage, rather than comparing the risk for cancers at one single site in each lifestage, as the U.S. EPA did. In addition, the age groupings are a bit different in the U.S. EPA analysis than those used by OEHHA in their analysis (described above). For example, prenatal (*in utero*) exposures were not part of the analysis performed by U.S. EPA, and that Agency's analyses did not distinguish between postnatal and juvenile exposures.

U.S. EPA oral exposure cancer risk methodology relies on estimation of the lifetime average daily dose, which can account for exposure factor differences between adults and children (e.g. eating habits and body weight). However, early lifestage susceptibility differences have not been taken into consideration when cancer potency factors were calculated. The Supplemental Guidance document focused on studies that define the potential duration and degree of increased susceptibility that may arise from early-life exposures. An analysis of those studies including a detailed description of the procedures used was published in Barton *et al.* (2005) (included as Appendix I). The criteria used to decide if a study could be included in the quantitative analysis are as follows (excerpted from U.S. EPA, 2005b):

1. Exposure groups at different post-natal ages in the same study or same laboratory, if not concurrent (to control for a large number of potential cross-laboratory experimental variables including pathological examinations),
2. Same strain/species (to eliminate strain-specific responses confounding age-dependent responses),
3. Approximately the same dose within the limits of diets and drinking water intakes that obviously can vary with age (to eliminate dose-dependent responses confounding age-dependent responses),
4. Similar latency period following exposures of different ages (to control for confounding latency period for tumor expression with age-dependent responses), arising from sacrifice at >1 year for all groups exposed at different ages, where early-life exposure can occur up to about 7 weeks. Variations of around 10 to 20% in latency period are acceptable,
5. Postnatal exposure for juvenile rats and mice at ages younger than the standard 6 to 8 week start for bioassays; prenatal (*in utero*) exposures are not part of the current analysis. Studies that have postnatal exposure were included (without adjustment) even if they also involved prenatal exposure,
6. "Adult" rats and mice exposure beginning at approximately 6 to 8 weeks old or older, i.e. comparable to the age at initiation of a standard cancer bioassay (McConnell, 1992). Studies with animals only at young ages do not provide appropriate comparisons to evaluate age-dependency of response (e.g., the many neonatal mouse cancer studies). Studies in other species were used as supporting evidence, because they are relatively rare and the determination of the appropriate comparison ages across species is not simple, and
7. Number of affected animals and total number of animals examined are available or reasonably reconstructed for control, young, and adult groups (i.e., studies reporting only percent response or not including a control group would be excluded unless a reasonable estimate of historical background for the strain was obtainable).

MV00170416

Cancer potencies were estimated from a one-hit model (a restricted form of the Weibull time-to-tumor model), which estimates cumulative incidence for tumor onset. U.S. EPA (2005b) compared the estimated ratio of the cancer potency from early-life exposure to the estimated cancer potency from adult exposure. The general form of the equation for the tumor incidence at a particular dose, [P(dose)] is:

$$P(dose) = 1-[1-P(0)]\exp(-\text{cancer potency}*\text{dose})$$

where P(0) is the incidence of the tumor in controls. The ratio of juvenile to adult cancer potencies at a single site were calculated by fitting this model to the data for each age group. The model fit depended upon the design of the experiment that generated the data. Studies evaluated by U.S. EPA had two basic design types: experiments in which animals were exposed either as juveniles or as adults (with either a single or multiple dose in each period), and experiments in which exposure began either in the juvenile or in the adult period, but once started, continued through life.

The model equations for the first study type are:

$$P_A = P_0 + (1-P_0)\,(1-e^{-m_A \delta_A})$$

$$P_J = P_0 + (1-P_0)\,(1-e^{-m_A e^{\lambda} \delta_J})$$

where A and J refer to the adult and juvenile period, respectively, λ is the natural logarithm of the juvenile:adult cancer potency ratio, P_0 is the fraction of control animals with the particular tumor type being modeled, P_x is the fraction of animals exposed in age period x with the tumor, m_A is the cancer potency, and δ_x is the duration or number of exposures during age period x.

The goal of the model is to determine λ, which is the logarithm of the estimated ratio of juvenile to adult cancer potencies. This serves as a measure of potential susceptibility for early-life exposure.

For the second study type, the model equations take into account that exposures that were initiated in the juvenile period continue through the adult period. The model equations for the fraction of animals exposed only as adults with tumors in this design are the same as in the first study type, but the fraction of animals whose first exposure occurred in the juvenile period is:

$$P_J = P_0 + (1-P_0)\,(1-e^{-m_A e^{\lambda}(\delta_J - \delta_A) - m_A \delta_A})$$

δ_J includes the duration of exposure during the juvenile period and the subsequent adult period.

Parameters in these models were estimated using Bayesian methods and all inferences about the ratios were based on the marginal posterior distribution of λ. A complete description of these procedures (including the potential effect of alternative Bayesian priors that were examined) was published in Barton *et al.* (2005) (Appendix I). This method produced a posterior mean ratio of the early-life to adult cancer potency, which is an estimate of the potential susceptibility of early-life exposure to carcinogens. Ratios of greater or less than one indicate greater or less susceptibility from early-life exposure, respectively.

MV00170417

U.S. EPA reviewed several hundred studies reporting information on 67 chemicals or complex mixtures that are carcinogenic via perinatal exposure. Eighteen chemicals were identified which had animal study designs involving early-life and adult exposures in the same experiment. Of those 18 chemicals, there were overlapping subsets of 11 chemicals involving repeated exposures during early postnatal and adult lifestages and 8 chemicals using acute exposures (usually single doses) at different ages. Those chemicals are listed in Table 4~~Table 4Table 4~~.

Table 4 Chemicals having animal cancer study data available with early-life and adult exposures in the same experiment.

Chemical	Study Type
Amitrole	repeat dosing
Benzidine	repeat dosing
Benzo[a]pyrene (BaP)	acute exposure
Dibenzanthracene (DBA)	acute exposure
Dichlorodiphenyltrichloroethane (DDT)	lifetime exposure, repeat dosing
Dieldrin	lifetime exposure, repeat dosing
Diethylnitrosamine (DEN)	acute exposure, lifetime exposure
Dimethylbenz[a]anthracene (DMBA)	acute exposure
Dimethylnitrosamine (DMN)	acute exposure
Diphenylhydantoin, 5,5-(DPH)	lifetime exposure, repeat dosing
Ethylnitrosourea (ENU)	acute exposure
Ethylene thiourea (ETU)	lifetime exposure, repeat dosing
3-Methylcholanthrene (3-MC)	repeat dosing
Methylnitrosourea (NMU)	acute exposure
Polybrominated biphenyls (PBBs)	lifetime exposure, repeat dosing
Safrole	lifetime exposure, repeat dosing
Urethane	acute exposure, lifetime exposure
Vinyl chloride (VC)	repeat dosing

U.S. EPA calculated the difference in susceptibility between early-life and adult exposure as the estimated ratio of cancer potency at specific sites from early-life exposure over the cancer potency from adult exposure for each of the studies that were determined qualitatively to have appropriate study designs and adequate data. The results were grouped into four categories: 1) mutagenic chemicals administered by a chronic dosing regimen to adults and repeated dosing in the early postnatal period (benzidine, diethylnitrosamine, 3-methylcholanthrene, safrole, urethane and vinyl chloride); 2) chemicals without positive mutagenicity data administered by a chronic dosing regimen to adults and repeated dosing in the early postnatal period (amitrole, dichlorodiphenyltrichloroethane (DDT), dieldrin, ethylene thiourea, diphenylhydantoin, polybrominated biphenyls); 3) mutagenic chemicals administered by an acute dosing regimen

MV00170418

(benzo[*a*]pyrene, dibenzanthracene, diethylnitrosamine, dimethylbenzanthracene, dimethylnitrosamine, ethylnitrosourea, methylnitrosourea and urethane); 4) chemicals with or without positive mutagenicity data with chronic adult dosing and repeated early postnatal dosing.

The acute dosing animal cancer studies were considered qualitatively useful by U.S. EPA because they involve identical exposures with defined doses and time periods demonstrating that differential tumor incidences arise exclusively from age-dependent susceptibility. However, they were not used to derive a quantitative cancer potency factor age adjustment, primarily because most of the studies used subcutaneous or intraperitoneal injection as a route of exposure. These methods have not been considered quantitatively relevant routes of environmental exposure for human cancer risk assessment by U.S. EPA, for reasons including the fact that these routes of exposure are expected to have a partial or complete absence of first pass metabolism which could affect potency estimates. Additionally, U.S. EPA decided that cancer potency estimates are usually derived from chronic exposures, and therefore, any adjustment to those potencies should be from similar exposures.

The repeated dosing studies with mutagenic chemicals using exposures during early postnatal and adult lifestages were used to develop a quantitative cancer potency factor age adjustment. Studies with repeated early postnatal exposure were included in the analysis even if they also involved earlier maternal and/or prenatal exposure, while studies addressing only prenatal exposure were not used in the analysis. The weighted geometric mean susceptibility ratio (juvenile to adult) for repeated and lifetime exposures in this case was 10.4 (range 0.12 – 111, 42% of ratios greater than 1).

USEPA suggests the use of age-dependent-adjustment factors (ADAF) for chemicals acting through a mutagenic mode of action., based on the results of the preceding analysis, which concluded that cancer risks generally are higher from early-life exposure than from similar exposure doses and durations later in life:

1. For exposures before 2 years of age (i.e., spanning a 2-year time interval from the first day of birth until a child's second birthday), a 10-fold ADAF.

2. For exposures between 2 and <16 years of age (i.e., spanning a 14-year time interval from a child's second birthday until their sixteenth birthday), a 3-fold ADAF.

3. For exposures after turning 16 years of age, no adjustment (ADAF=1).

The ADAF of 10 used for the 0 – 2 years of age range is approximately the weighted geometric mean cancer potency ratio from juvenile versus adult exposures in the repeated dosing studies. U.S. EPA considered this period to display the greatest toxicokinetic and toxicodynamic differences between children and adults. Data were not available to calculate a specific dose-response adjustment factor for the 2 to <16-year age range, so EPA selected an ADAF of 3 because it was half the logarithmic scale difference between the 10-fold adjustment for the first two years of life and no adjustment (*i.e.*, 1-fold) for adult exposure. The ADAF of 3 represents an intermediate level of adjustment applied after 2 years of age through <16 years of age. The upper age limit (16 years of age) reflects the end of puberty and the attainment of a final body height. U.S. EPA recognizes that the use of a weighted geometric mean of the available study

MV00170419

data to develop an ADAF for cancer potencies may either overestimate or underestimate the actual early-life cancer potency for specific chemicals, and therefore emphasizes in the Supplemental Guidance that chemical-specific data should be used in preference to these default adjustment factors whenever such data are available.

U.S. EPA is recommending the ADAFs described above only for mutagenic carcinogens, because the data for non-mutagenic carcinogens were considered to be too limited and the modes of action too diverse to use this as a category for which a general default adjustment factor approach can be applied. OEHHA considers this approach to be insufficiently health protective. There is no obvious reason to suppose that the toxicokinetics of non-mutagens would be systematically different from those of mutagens. It would also be inappropriate to assume by default that non-mutagenic carcinogens are assumed to need a toxicodynamic correction factor of 1. Most if not all of the factors that make individuals exposed to carcinogens during an early-lifestage potentially more susceptible than those individuals exposed during adulthood also apply to non-mutagenic carcinogen exposures (*e.g.*, rapid growth and development of target tissues, potentially greater sensitivity to hormonal carcinogens, differences in metabolism). It should also be noted that carcinogens that do not cause gene mutations may still be genotoxic by virtue of causing chromosomal damage. Additionally, many carcinogens do not have adequate data available for deciding on a specific mode of action, or do not necessarily have a single mode of action. For these reasons, OEHHA will apply the default cancer potency factor age adjustments described above to all carcinogens unless data are available which allow for the development of chemical-specific cancer potency factor age adjustments. In those cases, an agent-specific model of age dependence (based on observational or experimental data) might be used, or alternative (larger or smaller) adjustment factors and age ranges may be applied where understanding of the mechanism of action and target tissues makes this appropriate.

MV00170420

Other Source Documents for Cancer Risk Assessment Guidance

As noted previously, the cancer potencies and unit risks tabulated in this technical support document have been developed by various programs over a number of years. The methods used therefore necessarily varied according to the date of the assessment and the program responsible. The following section summarizes the sources and procedures most commonly applied, and their historical context where this is apposite.

United States Environmental Protection Agency (U.S. EPA)

The U.S. EPA was one of the first regulatory agencies to develop and apply cancer risk assessment methodology. Their guidance documents and technical publications have been influential for many programs, including the California Air Toxics (Toxic Air Contaminants and Hot Spots) programs.

Guidelines for Carcinogen Risk Assessment (U.S. EPA, 1986)

Prior to the more recent guidelines updating project which, after nearly ten years of internal and public review drafts culminated in the 2005 final revision (see below), U.S. EPA carcinogen risk assessment procedures were generally as described in Anderson *et al.* (1983) and "Guidelines for Carcinogen Risk Assessment" (U.S. EPA, 1986). These methods, which are outlined below, were used to calculate the Integrated Risk Information System (IRIS) cancer potency values, some of which are cited in this document. U.S. EPA has always indicated that cancer risk estimates based on adequate human epidemiologic data are preferred if available over estimates based on animal data. Although the newer guidelines offer alternative methods for dose-response analysis of animal bioassays, and updated consideration of specific topics such as lifestage-related differences in sensitivity, and mechanism of action for some types of carcinogen, the underlying principles, and many of the specific procedures developed in these original guidelines are still applicable and in use.

U.S. EPA Calculation of Carcinogenic Potency Based on Animal Data

In extrapolating low-dose human cancer risk from animal carcinogenicity data, it is generally assumed that most agents that cause cancer also damage DNA, and that the quantal type of biological response characteristic of mutagenesis is associated with a linear non-threshold dose-response relationship. U.S. EPA stated that the risk assessments made with this model should be regarded as conservative, representing the most plausible upper limit for the risk. The mathematical expression used by U.S. EPA in the 1986 guidelines to describe the linear non-threshold dose-response relationship at low doses is the linearized multistage procedure developed by Crump (1980). This model is capable of fitting almost any monotonically increasing dose-response data, and incorporates a procedure for estimating the largest possible linear slope at low extrapolated doses that is consistent with the data at all experimental dose levels. A description of the linearized multistage procedure has been provided above (page 292928). U.S. EPA used an updated version (GLOBAL86, Howe *et al.*, 1986) of the computer program GLOBAL79 developed by Crump and Watson (1979) to calculate the point estimate and the 95% upper confidence limit of the extra risk $A(d)$.

MV00170421

U.S. EPA separated tumor incidence data according to organ sites or tumor types. The incidence of benign and malignant tumors was combined whenever scientifically defensible. U.S. EPA considered this incidence combination scientifically defensible unless the benign tumors are not considered to have the potential to progress to the associated malignancies of the same histogenic origin. The primary comparison in carcinogenicity evaluation is tumor response in dosed animals as compared to contemporary matched control animals. However, U.S. EPA stated that historical control data could be used along with concurrent control data in the evaluation of carcinogenic responses, and notes that for the evaluation of rare tumors, even small tumor responses may be significant compared to historical data. If several data sets (dose and tumor incidence) are available (different animal species, strains, sexes, exposure levels, exposure routes) for a particular chemical, the data set used in the model was the set where the incidence is statistically significantly higher than the control for at least one test dose level and/or where the tumor incidence rate shows a statistically significant trend with respect to dose level. The data set generating the highest lifetime cancer risk estimate (q_1^*) was chosen where appropriate. An example of an inappropriate data set would be a set which generates an artifactually high risk estimate because of a very small number of animals used. If there are 2 or more data sets of comparable size for a particular chemical that are identical with respect to species, strain, sex and tumor sites, the geometric mean of q_1^* estimated from each of those data sets was used for risk estimation. U.S. EPA assumed that mg/surface area/day is an equivalent dose between species. Surface area was further assumed to be proportional to the 2/3 power of the weight of the animal in question. Equivalent dose was therefore computed using the following relationship:

$$\mathrm{d} = \frac{l_e * m}{L_e * W^{2/3}}$$

where L_e = experimental duration, l_e = exposure duration, m = average dose (mg/day) and W = average animal weight. Default average body weights for humans, rats and mice are 70, 0.35 and 0.03 kg, respectively.

Exposure data expressed as ppm in the diet were generally converted to mg/day using the relationship m = ppm * F * r, where ppm is parts per million of the chemical in the diet, F is the weight of the food consumed per day in kg, and r is the absorption fraction (assumed to be 1 in the absence of data indicating otherwise). The weight of food consumed, calories required, and animal surface area were generally all considered to be proportional to the 2/3 power of the animal weight, so:

$$m \quad \text{ppm} * W^{2/3} * r, \text{ or } \quad \frac{m}{rW^{2/3}} \quad \text{ppm}$$

The relationship could lead to the assumption that dietary ppm is an equivalent exposure between species. However, U.S. EPA did not believe that this assumption is justified, since the calories/kg food consumed by humans is significantly different from that consumed by laboratory animals (primarily due to differences in moisture content). An empirically derived food factor, $f = F/W$ was used, which is the fraction of a species' body weight consumed per day as food. U.S. EPA (1986) gave the f values for humans, rats and mice as 0.028, 0.05 and 0.13, respectively.

MV00170422

Dietary exposures expressed as concentrations in ppm were converted to mg/surface area using the following relationship:

$$\frac{m}{r * W^{2/3}} = \frac{\text{ppm} * F}{W^{2/3}} = \frac{\text{ppm} * f * W}{W^{2/3}} = \text{ppm} * f * W^{2/3}$$

Exposures expressed as mg/kg/day ($m/Wr = s$) were converted to mg/surface area using the relationship:

$$\frac{m}{rW^{2/3}} = s * W^{2/3}$$

The calculation of dose when exposure is via inhalation was performed for cases where 1) the chemical is either a completely water-soluble gas or aerosol and is absorbed proportionally to the amount of inspired air, or 2) where the chemical is a partly water-soluble gas which reaches an equilibrium between the inspired air and body compartments. After equilibrium is attained, the rate of absorption is proportional to metabolic rate, which is proportional to the rate of oxygen consumption, which is related to surface area.

Exposure expressed as mg/day to completely water-soluble gas or aerosols can be calculated using the expression $m = I * v * r$, where I is the inspiration rate/day in m^3, v is the concentration of the chemical in air (mg/m^3), and r is the absorption fraction (assumed to be the same for all species in the absence of data to the contrary; usually 1). For humans, the default inspiration rate of 20 m^3 has been adopted. Inspiration rates for 113 g rats and 25 g mice have been reported to be 105 and 34.5 liters/day, respectively. Surface area proportionality can be used to determine inspiration rate for rats and mice of other weights; for mice, $I = 0.0345\ (W / 0.025)^{2/3}\ m^3/day$; for rats, $I = 0.105\ (W / 0.113)^{2/3}\ m^3/day$. The empirical factors for air intake/kg/day (i) for humans, rats and mice are 0.29, 0.64 and 1.3, respectively. Equivalent exposures in mg/surface area can be calculated using the relationship:

$$\frac{m}{W^{2/3}} = \frac{Ivr}{W^{2/3}} = \frac{iWvr}{W^{2/3}} = iW^{1/3}vr$$

Exposure expressed as mg/day to partly water-soluble gases is proportional to surface area and to the solubility of the gas in body fluids (expressed as an absorption coefficient r for that gas). Equivalent exposures in mg/surface area can be calculated using the relationships $m = kW^{2/3} * v * r$, and $d = m/W^{2/3} = kvr$. The further assumption is made that in the case of route-to-route extrapolations (e.g., where animal exposure is via the oral route, and human exposure is via inhalation, or vice versa), unless pharmacokinetic data to the contrary exist, absorption is equal by either exposure route.

Adjustments were made for experimental exposure durations shorter than the lifetime of the test animal; the slope q_1^* was increased by the factor $(L/L_e)^3$, where L is the normal lifespan of the experimental animal and L_e is the duration of the experiment. This assumed that if the average dose d is continued, the age-specific rate of cancer will continue to increase as a constant function of the background rate. Since age-specific rates for humans increase by at least the 2nd power of the age, and often by a considerably higher power (Doll, 1971), there is an expectation

MV00170423

that the cumulative tumor rate, and therefore q_1^*, will increase by at least the 3rd power of age. If the slope q_1^* is calculated at age L_e, it would be expected that if the experiment was continued for the full lifespan L at the same average dose, the slope q_1^* would have been increased by at least $(L/L_e)^3$.

U.S. EPA Calculation of Carcinogenic Potency Based on Human Data

U.S. EPA stated that existing human epidemiologic studies with sufficiently valid exposure characterization are always used in evaluating the cancer potency of a chemical. If they showed a carcinogenic effect, the data were analyzed to provide an estimate of the linear dependence of cancer rates on lifetime cancer dose (equivalent to the factor q_1^*). If no carcinogenic effect was demonstrated and carcinogenicity had been demonstrated in animals, then it was assumed that a risk does exist, but it is smaller than could have been observed in the epidemiologic study. An upper limit of cancer incidence was calculated assuming that the true incidence is just below the level of detection in the cohort studied, which is largely determined by the cohort size. Whenever possible, human data are used in preference to animal data. In human epidemiologic studies, the response is measured as the relative risk of the exposed cohort of individuals compared to the control group. The excess risk ($R(X)$ - 1, where $R(X)$ is relative risk) was assumed to be proportional to the lifetime average exposure X, and to be the same for all ages. The carcinogenic potency is then equal to $[R(X) - 1]/X$ multiplied by the lifetime risk at that site in the general population. According to this original procedure, the confidence limit for the excess risk was not usually calculated: this decision was ascribed to the difficulty in accounting for inherent uncertainty in the exposure and cancer response data. More recent assessments have taken the opposite view and attempted to calculate and characterize this uncertainty by determining confidence limits, *inter alia*.

Guidelines for Carcinogen Risk Assessment (U.S. EPA, 2005a)

U.S. EPA revised its "Guidelines for Carcinogen Risk Assessment" (referred to henceforth as the "U.S. EPA Guidelines") in 2005. Compared to the 1986 version of this document, more emphasis is placed on establishing a "mode of action" (MOA). The following excerpt provides a definition of this term:

> "The term "mode of action" is defined as a sequence of key events and processes, starting with interaction of an agent with a cell, proceeding through operational and anatomical changes, and resulting in cancer formation. A "key event" is an empirically observable precursor step that is itself a necessary element of the mode of action or is a biologically based marker for such an element. Mode of action is contrasted with "mechanism of action," which implies a more detailed understanding and description of events, often at the molecular level, than is meant by mode of action".

Cancer risk assessments performed under the prior U.S. EPA Guidelines sometimes included a MOA description. However, the 1986 U.S. EPA Guidelines did not explicitly mandate the development of a MOA description in cancer risk assessments.

The MOA information is then used to govern how a cancer risk assessment shall proceed. Tumor incidence data sets arising from a MOA judged to be not relevant to humans are not used

MV00170424

to extrapolate a cancer potency factor. If an MOA cannot be determined or is determined to have a low-dose linear dose-response and a nonmutagenic MOA, then a linear extrapolation method is used to develop a cancer potency factor. The same linear extrapolation is used for all lifestages, unless chemical specific information on lifestage or population sensitivity is available. Carcinogens that act via an MOA judged to have a nonlinear low-dose dose response are modeled using MOA data, or the RfD/RfC risk assessment method is used as a default. Adjustments for susceptible lifestages or populations are to be performed as part of the risk assessment process.

If a carcinogen is deemed to act via a mutagenic MOA, then the data from the MOA analysis is evaluated to determine if chemical-specific differences between adults and juveniles exist and can be used to develop a chemical-specific risk estimate incorporating lifestage susceptibility. If this cannot be done, then early-life susceptibility is assumed, and age-dependent adjustment factors (ADAFs) are applied as appropriate to develop risk estimates. In cases where it is not possible to develop a toxicokinetic model to perform cross-species scaling of animal tumor data sets which arise from oral exposures, the U.S. EPA Guidelines state that administered doses should be scaled from animals to humans on the basis of equivalence of $mg/kg^{3/4}$-d (milligrams of the agent normalized by the 3/4 power of body weight per day). This is a departure from the 1986 U.S. EPA guidelines, which used a 2/3 power of body weight normalization factor. Other adjustments for dose timing, duration and route are generally assumed to be handled in similar fashion to that described for the 1986 guidelines, although of course updated parameter values would be used where available.

The 2005 U.S. EPA Guidelines also use benchmark dose methodology (described above, page 27) to develop a "point-of departure" (POD) from tumor incidence data. For linear extrapolation, the POD is used to calculate a cancer potency factor, and for nonlinear extrapolation the POD is used in the calculation of a reference dose (RfD) or reference concentration (RfC).

It should be noted that none of the cancer potency factors listed in this document were obtained from U.S. EPA risk assessments performed under the 2005 U.S. EPA Guidelines. All U.S. EPA IRIS cancer potency values contained in this document were obtained from risk assessments using the 1986 U.S. EPA Guidelines.

Office of Environmental Health Hazard Assessment (OEHHA), California Environmental Protection Agency

The cancer risk assessment procedures originally used by the Office of Environmental Health Hazard Assessment (OEHHA) are outlined in "Guidelines for Chemical Carcinogen Risk Assessments and their Scientific Rationale" (referred to below as the Guidelines) (CDHS, 1985). These procedures were generally used in generating Toxic Air Contaminant (TAC) cancer potency values, standard Proposition 65 cancer potency values and Public Health Goal (PHG) cancer potency values. Expedited Proposition 65 cancer potency values depart somewhat from those procedures and are discussed separately below.

OEHHA cancer risk assessment methodology as described by CDHS (1985) generally resembled that used at that time by U.S. EPA (Anderson *et al.*, 1983; U.S. EPA, 1986). OEHHA risk

MV00170425

assessment practice similarly reflects the evolution of the technical methodology (e.g. as described in U.S. EPA, 2005a) since the original guidelines were published. The basic principles and procedures described below are still considered applicable. More recent additions to OEHHA cancer risk assessment methods such as the use of benchmark dose methodologies and early-lifestage cancer potency adjustments are discussed above. The Guidelines state that both animal and human data, when available, should be part of the dose-response assessment.

OEHHA Calculation of Carcinogenic Potency Based on Animal Data

The procedures used to extrapolate low-dose human cancer risk from animal carcinogenicity data assumed that a carcinogenic change induced in a cell is transmitted to successive generations of cell descendents, and that the initial change in the cell is an alteration (e.g. mutation, rearrangement, etc.) in the cellular DNA. Non-threshold models are used to extrapolate to low-dose human cancer risk from animal carcinogenicity data.

Several models were proposed for extrapolating low-dose human cancer risk from animal carcinogenicity data in the original Guidelines. These models include the Mantel-Bryan method (log-probit model), the one-hit model, the linearized multistage procedure, the gamma multihit model, and a number of time-to-tumor models. The Guidelines stated that time-to-tumor models (i.e., a Weibull-in-time model) should be used for low-dose extrapolation in all cases where supporting data are available, particularly when survival is poor due to competing toxicity. However, the Guidelines also noted the difficulty of determining the actual response times in an experiment. Internal tumors are generally difficult to detect in live animals and their presence is usually detected only at necropsy. Additionally, use of these models often requires making the determination of whether a tumor was the cause of death, or was found only coincidentally at necropsy when death was due to other causes. Further, competing causes of death, such as chemical toxicity, may decrease the observed time-to-tumor for nonlethal cancers by allowing earlier necropsy of animals in higher dose groups. The linearized multistage (LMS) procedure was noted as being an appropriate method for dose extrapolation in most cases, with the primary exception being a situation in which sufficient empirical data are available to indicate a dose-response curve of a "quasi-threshold" type (e.g., flat for two or three dose levels, then curving sharply upwards). In this case, the LMS procedure may underestimate the number of stages and overestimate the low-dose risks. In this case, the gamma multihit model was suggested as being a potential alternative. The Mantel-Bryan model was described as having little biological basis as applied to carcinogenesis, and being likely to underestimate risks at low doses. The Guidelines stated that this model should not be used for low dose extrapolation. More recent practice has departed from these original guidelines in some respects, for instance by experimenting with cell-proliferation based models in a few cases: however the LMS model remained the preferred extrapolation model for most purposes. Some of the difficulties in achieving a satisfactory fit to tumor incidence data were found to be alleviated by application of toxicokinetic models and use of an internal rather than applied dose metric with the LMS model. This has resulted in the alternative models originally advocated (Gamma multihit, Mantel-Bryan) being mostly abandoned. As noted above (Dose-Response Assessment, page 23), the use of allegedly biologically based statistical models such as LMS has fallen from favor in recent years, and benchmark dose methodology has become the preferred method for extrapolating cancer potency values from animal cancer incidence data. However, it should also be noted that results

MV00170426

generated by the LMS model and benchmark dose methodology from the same data set are often quite similar.

The 1985 Guidelines stated that both animal and human data, when available, should be part of the dose-response assessment. Although preference was given to human data when these were of adequate quality, animal studies may provide important supporting evidence. Low-dose extrapolation of human cancer risk from animal carcinogenicity data was generally based on the most sensitive site, species and study demonstrating carcinogenicity of a particular chemical, unless other evidence indicates that the data set in question is not appropriate for use. Where both benign and malignant tumors are induced at the same site and the benign tumors are considered to have the potential to progress to malignant tumors, the incidence data for both types of tumors could be combined to form the basis for risk assessment. Pharmacokinetic data on chemical metabolism, effective dose at target site, or species differences between laboratory test animals and humans were considered in dose-response assessments when available. In performing exposure scaling from animals to humans, the "surface area" correction (correcting by the 2/3 power of body weight) was used unless specific data indicates that this should not be done. The Guidelines assumed that in the absence of evidence to the contrary, chemicals that cause cancer after exposure by ingestion will also cause cancer after exposure by inhalation, and vice versa. These original proposals have continued in use with little change except that currently, TAC and PHG cancer potency factor calculations use a 3/4 power of body weight correction for interspecies scaling, in line with current U.S. EPA practice. The standard Proposition 65 cancer potency factor calculations still use a 2/3 power correction because the cancer potency calculation method is specified in regulation (California Health and Safety Code 25249.5 *et seq.*).

Cancer unit risk factors [in units of $(\mu g/m^3)^{-1}$]have been calculated from cancer potency factors [in units of $(mg/kg\text{-}day)^{-1}$] using the following relationship:

$$UR = \frac{CPF * 20\ m^3}{70\ kg\ *\ CV}$$

where UR is the cancer unit risk, CPF is the cancer potency factor, 70 kg is the reference human body weight, 20 m^3 is the reference human inspiration rate/day, and CV is the conversion factor from mg to µg (= 1000). The cancer unit risk describes the excess cancer risk associated with an inhalation exposure to a concentration of 1 $\mu g/m^3$ of a given chemical; the cancer potency factor describes the excess cancer risk associated with exposure to 1 mg of a given chemical per kilogram of body weight.

It should be noted that although this default method is still used in deriving published cancer unit risk values, for site-specific risk assessments age-appropriate distributions and percentile values are used in the current version of the Hot Spots exposure assessment document. Where exposure to children occurs (as it does in most exposures to the general population surrounding a source site) it is also necessary to apply the age-specific adjustment factors for the appropriate durations in accordance with the guidance offered above (Page 30 *et seq.*).

MV00170427

OEHHA Calculation of Carcinogenic Potency Based on Human Data

Human epidemiologic studies with adequate exposure characterization are used to evaluate the cancer potency of a chemical. If they show a carcinogenic effect, the data are analyzed to provide an estimate of the linear dependence of cancer rates on lifetime cancer dose. The 1985 Guidelines stated that with continuous exposure, age-specific incidence continues to increase as a power function (e.g., t^3 or t^4) of the elapsed time since initial exposure. Lifetime risks can be estimated by applying such a power function to the observed data and extrapolating beyond the actual followup period. OEHHA has generally undertaken the calculation of study power and confidence bounds on the potency estimate as important tools to establish the credibility of the estimate obtained and in comparing this with other estimates (from other human studies or from animal data). Due to the diversity in quality and type of epidemiological data, the specific approaches used in OEHHA risk assessments based on human epidemiologic studies vary on a case by case basis rather than following explicit general guidelines. Examples of the methods used can be observed in the Toxic Air Contaminant documents (these documents are listed in Appendix D: the methods used are described in the compound summaries provided in Appendix B).

Expedited Proposition 65 Cancer Risk Assessment Methodology

Expedited cancer potency values developed for several agents listed as carcinogens under Proposition 65 (California Health and Safety Code 25249.5 *et seq.*) were derived from selected animal carcinogenicity data sets of the Carcinogenic Potency Database (CPDB) of Gold *et al.* (1984, 1986, 1987, 1989, 1990, 1997) using default procedures specified in the administrative regulations for Proposition 65 (Title 22 California Code of Regulations [CCR] 12703). OEHHA hazard assessments usually describe all relevant data on the carcinogenicity (including dose-response characteristics) of the chemical under examination, followed by an evaluation of any pharmacokinetic and mechanistic (e.g. genotoxicity) data. An evaluation of the data set for the chemical may indicate that adjustments in target dose estimates or use of a dose response model different from the default are appropriate. The procedure used to derive expedited Proposition 65 cancer potency values differs from the usual methodology in two ways. First, it relies on cancer dose response data evaluated and extracted from the original literature by Gold *et al.* Second, the choice of a linearized multistage procedure for generating cancer potency values is automatic, and pharmacokinetic adjustments are not performed. The methods used to develop expedited cancer potency values incorporate the following assumptions:

1. The dose response relationship for carcinogenic effects in the most sensitive species tested is representative of that in humans.
2. Observed experimental results can be extrapolated across species by use of the interspecies factor based on "surface area scaling."
3. The dose to the tissue giving rise to a tumor is assumed to be proportional to the administered dose.
4. The linearized multistage polynomial procedure can be used to extrapolate potency outside the range of experimental observations to yield estimates of "low" dose potency.
5. Cancer risk increases with the third power of age.

MV00170428

The Carcinogenic Potency Database of Gold *et al.* (1984, 1986, 1987, 1989, 1990) contains the results of more than 4000 chronic laboratory animal experiments on 1050 chemicals by combining published literature with the results of Federal chemical testing programs (Technical Reports from the Carcinogenesis Bioassay Program of the National Cancer Institute (NCI)/National Toxicology Program (NTP) published prior to June 1987). The published literature was searched (Gold *et al.*, 1984) through the period December 1986 for carcinogenicity bioassays; the search included the Public Health Service publication "Survey of Compounds Which Have Been Tested for Carcinogenic Activity" (1948-1973 and 1978), monographs on chemical carcinogens prepared by the International Agency for Research on Cancer (IARC) and Current Contents. Also searched were Carcinogenesis Abstracts and the following journals: British Journal of Cancer, Cancer Letters, Cancer Research, Carcinogenesis, Chemosphere, Environmental Health Perspectives, European Journal of Cancer, Food and Cosmetics Toxicology, Gann, International Journal of Cancer, Journal of Cancer Research and Clinical Oncology (formerly Zeitschrift fur Krebsforschung und Klinische Onkologie), Journal of Environmental Pathology and Toxicology, Journal of Toxicology and Environmental Health, Journal of the National Cancer Institute, and Toxicology and Applied Pharmacology. Studies were included in the database if they met the following conditions:

1. The test animals were mammals.
2. Chemical exposure was started early in life (100 days of age or less for hamsters, mice and rats).
3. Route of administration was via the diet, drinking water, gavage, inhalation, intravenous injection or intraperitoneal injection.
4. The test chemical was administered alone (not in combination with other chemicals).
5. Chemical exposure was chronic (*i.e.*, duration of exposure was at least one-fourth the standard lifespan for that species), with not more than 7 days between exposures.
6. The experiment duration was at least half the standard lifespan for the species used.
7. The study design included a control group and at least 5 animals/exposure group.
8. No surgical interventions were performed.
9. Pathology data were reported for the number of animals with tumors (not total number of tumors).
10. All results reported were original data (not analysis of data reported by other authors).

Included in their data set tabulations are estimates of average doses used in the bioassay, resulting tumor incidences for each of the dose levels employed for sites where significant responses were observed, dosing period, length of study and histopathology. Average daily dose levels were calculated assuming 100% absorption. Dose calculations follow procedures similar to those of Cal/EPA and U.S. EPA; details on methods used and standard values for animal lifespans, body weights, and diet, water and air intake are listed in Gold *et al.* (1984). OEHHA (1992) reviewed the quality assurance, literature review, and control procedures used in compiling the data and found them to be sufficient for use in an expedited procedure. Cancer potency estimates were derived by applying the mathematical approach described in the section below to dose response data in the Gold *et al.* database.

MV00170429

The following criteria were used for data selection:

1. Data sets with statistically significant increases in cancer incidence with dose (p 0.05) were used. (If the authors of the bioassay report considered a statistically significant result to be unrelated to the exposure to the carcinogen, the associated data set was not used.)
2. Data sets were not selected if the endpoint was specified as "all tumor-bearing animals" or results were from a combination of unrelated tissues and tumors.
3. When several studies were available, and one study stood out as being of higher quality due to numbers of dose groups, magnitude of the dose applied, duration of study, or other factors, the higher quality study was chosen as the basis for potency calculation if study results were consistent with those of the other bioassays listed.
4. When there were multiple studies of similar quality in the sensitive species, the geometric mean of potencies derived from these studies was taken. If the same experimentalists tested two sexes of the same species/strain under the same laboratory conditions, and no other adequate studies were available for that species, the data set for the more sensitive sex was selected.
5. Potency was derived from data sets that tabulate malignant tumors, combined malignant and benign tumors, or tumors that would have likely progressed to malignancy.

Cancer potency was defined as the slope of the dose response curve at low doses. Following the default approach, this slope was estimated from the dose response data collected at high doses and assumed to hold at very low doses. The Crump linearized multistage polynomial (Crump *et al.*, 1977) was fit to animal bioassay data:

$$\text{Probability of cancer} = 1 - \exp[-(q_0 + q_1 d + q_2 d^2 + \ldots)]$$

Cancer potency was estimated from the upper 95 % confidence bound on the linear coefficient q_1, which is termed q_1^*.

For a given chemical, the model was fit to a number of data sets. As discussed in the section above, the default was to select the data for the most sensitive target organ in the most sensitive species and sex, unless data indicated that this was inappropriate. Deviations from this default occur, for example, when there are several bioassays or large differences exist between potency values calculated from available data sets.

Carcinogenicity bioassays using mice and/or rats will often use an exposure duration of approximately two years. For standard risk assessments, this is the assumed lifespan for these species. Animals in experiments of shorter duration are at a lower risk of developing tumors than those in the standard bioassay; thus potency is underestimated unless an adjustment for experimental duration is made. In estimating potency, short duration of an experiment was taken into account by multiplying q_1^* by a correction factor equal to the cube of the ratio of the assumed standard lifespan of the animal to the duration of the experiment (T_e). This assumes that the cancer hazard would have increased with the third power of the age of the animals had they lived longer:

$$q_{animal} = q_1^* * (104 \text{ weeks}/T_e)^3$$

MV00170430

In some cases excess mortality may occur during a bioassay, and the number of initial animals subject to late occurring tumors may be significantly reduced. In such situations, the above described procedure can, at times, significantly underestimate potency. A time-dependent model fit to individual animal data (i.e., the data set with the tumor status and time of death for each animal under study) may provide better potency estimates. When Gold *et al.* indicated that survival was poor for a selected data set, a time-dependent analysis was attempted if the required data were available in the Tox Risk (Crump *et al.*, 1991) data base. The Weibull multistage model (Weibull-in-time; multistage-in-dose) was fit to the individual animal data.

To estimate human cancer potency, q_{animal} values derived from bioassay data were multiplied by an interspecies scaling factor (K; the ratio of human body weight (bw_h) to test animal body weight (bw_a), taken to the 1/3 power (Anderson *et al.*, 1983)):

$$K = (bw_h/bw_a)^{1/3}$$

Thus, cancer potency = $q_{human} = K * q_{animal}$

Chemical-specific Descriptions of Cancer Potency Value Derivations

Unit Risk and potency values for chemicals whose cancer potency values were obtained from Toxic Air Contaminant documents, standard or expedited Proposition 65 documents, U.S. EPA's Integrated Risk Information System (IRIS) documents and Health Effects Assessment Summary Table (HEAST) entries, or from other documents prepared by OEHHA's Air Toxicology and Epidemiology Branch or Pesticide and Environmental Toxicology Branch are presented in Appendix A. Information summaries for these chemicals are presented in Appendix B.

MV00170442

Preface

Introduction

This *Noise Guidebook* has been prepared to serve as the basic reference document for all HUD field staff who are responsible for implementing the Department's noise policy. It brings together in one place all the various reports, informational papers and other items that have been put out by the Department over the past several years. It also contains several new items designed to make your job easier.

This *Guidebook* is designed to serve not only the experienced HUD staff member but also the new employee or the old employee who is new to the noise field. Because of this, the *Guidebook* contains some fairly basic background material as well as quizzes and other material specifically geared for the "learner."

MV00170443

Chapter 1

Basic Overview of the Environmental Noise Problem

Introduction

Background

Definition and Scope of the Noise Problem

The air around us is constantly filled with sounds, yet most of us would probably not say we are surrounded by noise. What then is the difference between ordinary sound and what we call noise? The traditional definition of noise is that it is "unwanted sound." Sound becomes unwanted when it either interferes with our normal activities such as sleeping, conversation or recreation, when it causes actual physical harm such as hearing loss or has adverse effects on mental health. As we have become a more urbanized country and as technology has advanced, the level of sound in our environment has reached the point when it sometimes does cause interference and does cause physical and psychological harm, and thus we have developed a noise problem. (See Figure 1 for a listing of common sounds.)

The dimensions of the noise problem have grown larger and larger over the past few decades. In its 1979 Annual Report, The Council on Environmental Quality stated that "nearly half the US population is regularly exposed to levels of noise that interfere with ...normal activities" and about "1 in 10 ...are exposed to noises of duration and intensity sufficient to cause a permanent reduction in their ability to hear."

Figure 1
Common Sounds
Basic Theory: Common Sounds in Decibels (dB)

Some common, easily recognized sounds are listed below in order of increasing sound intensity levels in decibels. The sound levels shown for occupied rooms are typical general activity levels only and do *not* represent criteria for design.

•dB are "average" values as measured on the A-scale of a sound-level meter
(From *Concepts in Architectural Acoustics:* M. David Egan, McGraw Hill, 1972.)

MV00170444

The Dynamics of the Noise Problem

There are basically two types of noise problems. There is the specific, job related, occupational noise problem created by extremely loud machinery. Then there is the community noise problem where the combined effect of many individual noise sources creates an overall noise level that is unacceptable. In the following pages we will be addressing the community noise problem only.

The main contributors to a community noise problem are transportation sources such as highways, railroads and airports. These sources are the most pervasive and continuing of the noise sources within the community. Of course, at any given site, there may be other noise sources which add to the problem, sources such as jackhammers at a construction site. But in general, and for the purposes of this section, the main concern is with the transportation sources.

The dynamics of a noise problem are based on the relationship between the noise source, the person or place exposed to the noise (hereafter called the receiver) and the path the noise will travel from source to receiver.

The source generates a given amount of noise which travels along the path and arrives at the receiver. The amount of noise will be reduced to some extent as a result of how long that path is or whether there are any barriers along the path. The severity of the impact on the receiver is a function of what type of activity is taking place, whether it is indoors or outdoors, and what type of building it is in if the activity is indoors. Figure 3 contains some basic compatibility guidelines.

The impact of the noise can be altered or mitigated by changing the characteristics of any of the three elements: source, path or receiver. Later on we will look at the various mitigation measures that are possible. Our concern however will be primarily with the receiver and the path. Control of the sources themselves is the specific responsibility of agencies such as the Environmental Protection Agency (EPA) or the Federal Aviation Administration (FAA).

The Dynamics of the Noise Problem

There are basically two types of noise problems. There is the specific, job related, occupational noise problem created by extremely loud machinery. Then there is the community noise problem where the combined effect of many individual noise sources creates an overall noise level that is unacceptable. In the following pages we will be addressing the community noise problem only.

The main contributors to a community noise problem are transportation sources such as highways, railroads and airports. These sources are the most pervasive and continuing of the noise sources within the community. Of course, at any given site, there may be other noise sources which add to the problem, sources such as jackhammers at a construction site. But in general, and for the purposes of this section, the main concern is with the transportation sources.

The dynamics of a noise problem are based on the relationship between the noise source, the person or place exposed to the noise (hereafter called the receiver) and the path the noise will travel from source to receiver.

The source generates a given amount of noise which travels along the path and arrives at the receiver. The amount of noise will be reduced to some extent as a result of how long that path is or whether there are any barriers along the path. The severity of the impact on the receiver is a function of what type of activity is taking place, whether it is indoors or outdoors, and what type of building it is in if the activity is indoors. Figure 3 contains some basic compatibility guidelines.

The impact of the noise can be altered or mitigated by changing the characteristics of any of the three elements: source, path or receiver. Later on we will look at the various mitigation measures that are possible. Our concern however will be primarily with the receiver and the path. Control of the sources themselves is the specific responsibility of agencies such as the Environmental Protection Agency (EPA) or the Federal Aviation Administration (FAA).

Figure 2
Dynamics of a Noise Problem

Figure 3
Land Use Compatibility Guidelines

MV00170446

The ideal solution to a potential problem is to reduce the noise being produced by the source. The best solution available to HUD, or the community, however, is to make sure that noise sensitive uses are located where they will not be exposed to high noise levels. The next best approach to mitigating noise impact is to attempt to reduce the amount of noise that reaches the receiver. This can be accomplished through the use of barriers such as walls or earthen berms, or combinations of both, along the noise path. If the use of barriers is not possible then the only alternative available is to provide noise reduction measures in any structures associated with the activity so that at least the interior spaces are not exposed to high noise levels. This approach is considered the least desirable because most of the land uses we are concerned about, such as residential, do have outdoor areas and activities associated with them which would remain exposed to high noise levels.

A Note on Descriptors

A key factor in the growth of our ability to evaluate and reduce noise impacts has been the development of better tools to measure and describe the noise levels generated by various sources. The development of better tools (called noise descriptors or metrics) has been particularly important for dealing with community noise problems. Many of the older descriptor systems could only be used for one or two sources such as cars and railroads, but not airplanes. Since the community noise problem very often includes noise from all these sources the lack of an adequate descriptor made it difficult to do an adequate evaluation.

The most advanced descriptor currently in general use is the day night average sound level system, abbreviated as DNL and symbolized mathematically as L_{dn}. The day night average sound level is the 24 hour average sound level, expressed in decibels, obtained after the addition of a 10 decibel penalty for sound levels which occur at night between 10 PM and 7 AM. This nighttime penalty is based on the fact that many studies have shown that people are much more disturbed by noise at night than at any other time. This is not unusual in that background noise is often much less at night and also people tend to be doing very noise sensitive things at night, such as trying to sleep.

Another feature of the DNL system that is very important is that it can be used to describe noise from all sources. Thus, using the DNL system, we can describe the total noise exposure at a site, something many other descriptor systems couldn't do.

The DNL system has been adopted by the EPA, the Department of Defense (DOD) and HUD, and more recently by the FAA, specifically for describing environmental impacts for airport actions. We expect that very soon it will be in almost universal use in the U.S.

Issues

The main issues involved in any noise analysis can be summarized briefly.

- How much noise is a site exposed to
- What types of activities are being affected and how severely
- Is it reasonable to redesign the site to relocate noise sensitive activities
- And, if not, how much protection can be provided through various attenuation measures.

Your approach to these issues will be affected in many ways by the location of the project in question. Projects in suburban or rural areas can be approached differently because the available mitigation options are greater and often the noise exposure itself is not so severe. In urban situations, however, the noise exposure is often more severe but at the same time the options for mitigation or resiting are more limited. In the urban setting innovative design and the use of advanced attenuation measures becomes critical. Fortunately our experience has shown that good design and construction can relieve or substantially reduce major noise problems.

Legal Provisions

General Legislation and Background

The Federal legislation which addresses noise issues is somewhat different from other environmental legislation. The Clean Air Act, for example, required the Environmental Protection Agency to set up actual mandatory standards for air quality which were supposed to be met by all jurisdictions. EPA even has the authority to take punitive steps against cities which are not making "reasonable further progress" towards achieving these air quality goals. There is no similar legislation that covers noise. The approach has been to tackle the noise problem at the source by controlling the amount of noise that can be emitted by the individual airplane engine or the individual jackhammer. Agencies like HUD or the Farmers Home Administration have developed regulations which are related to the overall community noise level, but they only affect their own programs and are not binding on local communities. The Veterans Administration program only relates to aircraft noise and also only affects its own programs.

The major pieces of Federal legislation related to noise include:

The Noise Control Act of 1972 directed EPA to promote an environment for all Americans free from noise that jeopardizes their health and welfare. It also included a requirement for EPA to set a criterion for noise level adequate to protect health and welfare with an adequate margin of safety but without regard to cost or feasibility.

Quiet Communities Act of 1978 amended The Noise Control Act of 1972 to encourage noise control programs at the State and community level.

Federal Aid Highway Act of 1970 established the requirement that noise control be a part of the planning and design of all federally aided highways.

Aviation Safety and Noise Abatement Act of 1979 requires FAA to develop a single system for measuring noise at airports and under certain conditions to prepare and publish noise maps.

MV00170447

HUD Regulations

While the Department of Housing and Urban Development has no specific responsibility to try to reduce the noise problem at the source the way the Environmental Protection Agency and the Federal Aviation Administration do, it does have the responsibility to be aware of the noise problem and its impact on the housing environment. The most basic mandate which drives the Department's involvement with the noise issue is the Housing Act of 1949 (Public Law 81-171) which sets forth the national goal of "a decent home and suitable living environment for every American family." This goal was affirmed by the Housing and Urban Development Act of 1968 (Public Law 90-448). The Department was tasked by the Housing and Urban Development Act of 1965 (Public Law 89-117) "to determine feasible methods of reducing the economic loss and hardships suffered by homeowners as a result of the depreciation in the value of their properties following the construction of airports in the vicinity of their homes." The Noise Control Act of 1972, in addition to its specific tasking to EPA, tasked all Federal agencies to administer their programs in ways which reduce noise pollution. Finally, the Department is tasked by Federal Management Circular 75-2: *Compatible Land Uses at Federal Airfields* to make sure that its actions do not promote incompatible land uses around Federal airfields.

All of these legislative and regulatory mandates combine to create a serious requirement for the Department of Housing and Urban Development to be aware of the problem of noise and to take positive steps to protect residential and other sensitive land uses from high noise levels.

The Department of Housing and Urban Development first issued formal requirements related specifically to noise in 1971 (HUD Circular 1390.2). These requirements contained standards for exterior noise levels along with policies for approving HUD supported or assisted housing projects in high noise areas. In general the requirements established three zones: an acceptable zone where all projects could be approved, a normally unacceptable zone where mitigation measures would be required and where each project would have to be individually evaluated for approval or denial, and an unacceptable zone in which projects would not, as a rule, be approved.

In 1979, the Department issued revised regulations (24 CFR Part 51B) which kept the same basic standards but adopted new descriptor systems which were considerably advanced over those in use under the old requirements.

HUD's regulations also require that recipients of Community Development Block Grants (CDBG) and Urban Development Action Grants (UDAG) take into consideration the noise criteria and standards in the environmental review process and consider ameliorative actions when noise sensitive land developments are proposed in noise exposed areas. If CDBG or UDAG activities are planned in a noisy area, and HUD assistance is contemplated later for housing and/or other noise sensitive activities, the HUD standards must be met for those activities.

Project Analysis

General

While most of the analysis for noise focuses on noise sources located around the project site, there are some characteristics of the project itself that you should know about. These characteristics will help you to determine what is called the noise assessment location (NAL) for site analysis. (The NAL is a representative point (or points) on the site where significant noise exposure is expected. All distances, etc. are measured from the NAL). This information will also be helpful later in evaluating the potential for mitigating or reducing the impact of noise. All of this data should be available from preliminary plans and specifications. If not, a quick phone call to the developer/sponsor should get you all the information you need.

Data Required

- Location of outdoor noise sensitive uses relative to the noise source.
- Location of buildings containing noise sensitive activities.
- Location of other buildings, particularly ones which might serve to shield sensitive buildings or areas from the noise source.
- Design and construction features of buildings, particularly features such as use of central air conditioning which could provide noise reduction benefits by permitting windows to be kept closed.

Analysis of Site and Environs

General

The primary focus of this impact analysis is on noise sources and the primary item to be determined is the noise level created by those sources. In many instances, particularly with airports, data on the noise levels generated by the source will have already been prepared by another agency such as the airport operator, the local or State highway/transportation department or other similar agency. (Figure 4 shows typical airport noise contours.) In those cases no site or environs analysis is necessary and one can proceed directly to impact analysis. For those instances where there are no current data already prepared, the Department of Housing and Urban Development has developed a handbook called the *Noise Assessment Guidelines* which contains a detailed desk top methodology for use by individuals to determine noise impacts (see Chapter 5). Included in the handbook is a complete listing of the data about the site and its environs that are necessary to conduct an analysis. We don't want to repeat all the detailed requirements here, but the following are some of the types of information you would have to collect if you were to do your own analysis. You might note that most of the information is related to the noise sources themselves.

For the purpose of analysis, the *Noise Assessment Guidelines* require that you consider all military/civilian airports within 15 miles of the project, all significant roads within 1000 feet and basically all railroads within 3000 feet.

MV00170448

Types of Data Required

- Number and type of vehicles
- Operational data:
  - speed
  - daytime/nighttime split
- Conditions where the vehicles are operated, i.e., freely flowing traffic versus stop and go, level versus hilly, welded railroad track versus bolted railroad track.

The *Noise Assessment Guidelines* contain guidance on sources for this data. Most of them are obtained from the "operator" of the transportation source. The *Guidelines* also contains model figures which can be used when actual data is unavailable. For example, if the actual number of vehicles traveling at night is not available then the *Guidelines* state that a figure of 15% should be used. Thus it is possible to make reasonably accurate noise level determinations even if some information is not available.

Determination of Impact

General

The specific procedures for determining the noise exposure levels for a site are clearly spelled out in the *Noise Assessment Guidelines*. The process is a fairly simple one in which the noise level from each source affecting the site is calculated and then combined to derive the overall exposure. If some kind of barrier exists or is proposed, the noise levels can be adjusted to reflect the mitigation provided by the barrier. The overall noise level is then compared to HUD's standards and the appropriate action, as spelled out in the regulations, is taken.

Figure 4
Noise Contours

MV00170449

Evaluation of Impact

HUD Regulations set forth the following exterior noise standards for new housing construction assisted or supported by the Department:

65 L_{dn} or less – Acceptable

Exceeding 65 L_{dn} but not exceeding 75 L_{dn} – Normally Unacceptable – appropriate sound attenuation measures must be provided: 5 decibels attenuation above the attenuation provided by standard construction required in 65 L_{dn} to 70 L_{dn} zone; 10 decibels additional attenuation in 70 L_{dn} to 75 L_{dn} zone.

Exceeding 75 L_{dn} – Unacceptable

HUD's regulations do not contain standards for interior noise levels. Rather a goal of 45 decibels is set forth and the attenuation requirements are geared towards achieving that goal. It is assumed that with standard construction any building will provide sufficient attenuation so that if the exterior level is 65 L_{dn} or less, the interior level will be 45 L_{dn} or less.

Once you have determined the overall noise exposure for the site you compare it to the above standards. If the overall site exposure is 65 L_{dn} or less the project is acceptable. If the exposure is between 65 L_{dn} and 75 L_{dn} you should consider alternative locations or providing adequate attenuation with the first preference, as we've noted, being for the construction of some kind of barrier to prevent noise from reaching the site. If providing adequate attenuation is impossible or impractical then the project should be considered unacceptable.

Suggested Mitigation

General Considerations

As discussed briefly earlier, there are three basic approaches for mitigating the high noise exposures. The first and best is to relocate noise sensitive uses out of the high noise area. The second is to prevent noise from reaching the noise sensitive user through some sort of barrier. And the third, and least desirable approach, is to provide attenuation for at least the interiors of any buildings located in the high noise areas.

Specific Considerations

Relocating Noise Sensitive Uses

By far the most desirable mitigation approach is to relocate noise sensitive uses out of the high noise area although. If the site is large enough it may be possible to locate non-noise sensitive uses between the source and the sensitive use, for example a parking lot might be located between a road and a park (see Figure 5). The workcharts in the *Noise Assessment Guidelines* can be used in reverse to tell you exactly how far away from the noise source you need to be.

When sites are small, very dense or when the source affects the entire site it is very difficult to mitigate by changing the site plan. Then the next option must be considered: erecting some type of barrier between the source and the receiver.

Barriers

Barriers are most effective for at or below ground level sources. They have no effect on noise from aircraft overflights and are limited in practical application with elevated sources such as elevated trains. The key to the effectiveness of a barrier is whether or not it breaks the line of sight between the source and the receiver. If a barrier does not completely break the line of sight either because it is not high enough, or not long enough then its effectiveness is greatly reduced.

Barriers can be actual walls, earthen mounds (called berms) or even other buildings. The use of other non-noise sensitive buildings as barriers is a particularly good approach in that it need not add to the cost of the project and may not create the aesthetic problem a large wall might create (see Figure 6).

Figure 5
The Audible Landscape

In cluster development, open space can be placed near the highway to reduce noise impacts on residences

MV00170450

Figure 6
The Audible Landscape

Placement of noise compatible land uses near highway in Planned Unit Development

Figure 7
The Audible Landscape

Use of acoustical architectural design to reduce noise impacts on more noise sensitive living spaces

As pointed out earlier, the effectiveness of a barrier is determined in large part by its height and length. Some studies have shown that the effectiveness of a barrier can be reduced by as much as 50% if it isn't long enough. Again, the *Noise Assessment Guidelines* contain procedures for determining the effectiveness of barriers.

Incorporating Noise Attenuation Measures into the Building

If neither relocation or barriers is a reasonable noise attenuation option, the last resort is to incorporate noise attenuation measures into the buildings themselves. This is not considered the best solution because it leaves the outdoor areas, some of which may be for quiet recreation, exposed to high noise levels. But if development **must** take place and barriers are impossible, then the noise attenuation measures should be employed in building design and construction.

Without going into great technical detail, noise attenuation construction measures generally fall into four categories.

(1) Reducing the total area of windows or other acoustically weaker building elements

(2) Sealing off "leaks" around windows, doors, vents.

(3) Improving the actual sound attenuating properties of small building elements such as windows, doors, etc.

(4) Improving the actual sound attenuating properties of major building elements such as roof and wall construction.

In addition, noise attenuation in buildings can be provided by designing interior spaces so that "dead" spaces such as closets or corridors act as buffer zones (see Figure 7). And finally noise attenuation can be provided by reducing the need for open windows by providing air conditioning.

Many of the steps that would be taken to provide noise attenuation also help conserve energy. Good weatherstripping around windows and doors is one example. Another might be reducing window areas in walls if the noise source is to the north or west. Because many of these measures serve two purposes, they should not necessarily be considered a burdensome requirement but rather just good design and construction.

Information Resources

Publications

HUD Regulation 24 CFR Part 51 Subpart B – Noise Abatement and Control.

Noise Assessment Guidelines, HUD 1983, basic technical procedural resource.

Aircraft Noise Impact, HUD 1972, a bit dated but good overview of problem.

The Audible Landscape, DOT (FHWA) 1974, an excellent discusson of mitigation measures including land use planning and building design and construction.

Information on Levels of Environmental Noise Requisite to Protect Public health and Welfare With an Adequate margin of Safety, EPA, 1974. The "levels document" that explains basis for EPA standards.

Noise Barrier Design Handbook, Federal Highway Administration 1976. Good discussion of barriers, technical but readable.

Handbook of Noise Control, 2nd edition, 1979, McGraw Hill. A basic technical handbook covering all aspects of noise for those who wish to go into the subject further.

Experts

HUD environmental officers have been trained in the use of the *Noise Assessment Guidelines* and can help you work with them. Many architects are trained in acoustics and can help in development of noise attenuation strategies.

Quiz

Questions

1. Why is noise considered "unwanted sound"?
2. What is a community noise problem?
3. What are the three main contributors to a community noise problem?
4. What are the three components of a noise problem?
5. What are two key characteristics of the day-night average sound level descriptor system?
6. What are HUD's noise standards?
7. How do HUD's standards apply to CDBG recipients?
8. What are the three general mitigation measures available to HUD and the community and in what order of preference?
9. When are barriers effective and when are they not effective?
10. Describe how the *Noise Assessment Guidelines* can be used to determine appropriate mitigation measures.

Quiz

Answers

1. because it interferes with normal activities or causes physical or psychological damage
2. a community noise problem is where the combined effect of many individual sources creates an overall noise level that is unacceptable
3. highways, railroads and aircraft
4. the source, the path, the receiver
5. it is an average sound level and it can be used for all sources
6. 65 L_{dn} or below: Acceptable
   65 to 75 L_{dn}: Normally unacceptable, noise attenuation measures required, above 75 L_{dn}: Unacceptable
7. CDBG recipients must take into consideration the standards in their planning and environmental review. If they expect to use HUD assistance later for housing or other noise sensitive activities the standards must be met for those activities.
8. 1st relocate noise sensitive uses
   2nd reduce noise reaching receiver
   3rd redesign buildings
9. barriers are effective for at or below ground level sources. Are not effective for aircraft overflights or most elevated sources
10. can be used to determine separation distance required for relocation and the height and length of barriers required

MV00170452

Chapter 2

The Noise Regulation

Introduction

The basic foundation for and structure of the HUD noise program is set out in the noise regulation, 24 CFR 51B. The regulation establishes the actual standards, assigns implementation responsibilities, describes review and approval procedures, and identifies special situations which may warrant waivers of procedures or standards. Therefore, the key to your understanding and implementation of the HUD noise program is a clear understanding of the regulation.

There is no way to escape the task of sitting down and simply reading the regulations, over and over until you thoroughly understand them. We have however done two things that will help you apply the regulations. First, for quick reference, we have prepared a list of the key sections in the regulation and second we have prepared an annotated copy of the regulation.

The list of key sections was prepared to help you find the specific section you need for a specific question or issue. While the regulation itself is not really long, an index is always useful. We caution you, however, against using the index to avoid learning the regulations. The list was prepared for your convenience in applying the regulation once you have come to understand it.

We prepared the annotated regulation because, try as we might, it was impossible to anticipate all the questions, implementation problems and special situations that might arise and to address them in the regulation. So, now that we have had a few years' experience with the regulation, we have gathered together the important questions, notes, second thoughts etc. and prepared this annotated regulation. We hope it will give you further insight into what the regulation means when it is applied in the field.

Key Sections in Noise Regulation

Section	Subject
51.101(a)(2)	Application of Policy to Block Grants
51.101(a)(3)	Policy for New Construction

Part 51—Environmental Criteria and Standards

Subpart A—General Provisions

Sec.
§51.1 Purpose.
§51.2 Authority.
§51.3 Responsibilities.
§51.4 Program coverage.
§51.5 Coordination with environmental clearance requirements.
§51.6 [Reserved]

Subpart B—Noise Abatement and Control
§51.100 Purpose and authority.
§51.101 General policy.
§51.102 Responsibilities.
§51.103 Criteria and standards.
§51.104 Special requirements.
§51.105 Exceptions.
§51.106 Implementation.

Appendix to Subpart B

Authority: Sec. 7(d). Department of HUD Act (42 U.S.C. 3535(d)).

Subpart B—Noise Abatement and Control

§51.100 Purpose and authority.

(a) *Purpose.* The Department of Housing and Urban Development finds that noise is a major source of environmental pollution which represents a threat to the serenity and quality of life in population centers and that noise exposure may be a cause of adverse physiological and psychological effects as well as economic losses.

It is the purpose of this Subpart to:

(1) Call attention to the threat of noise pollution;

(2) Encourage the control of noise at its source in cooperation with other Federal departments and agencies;

(3) Encourage land use patterns for housing and other noise sensitive urban needs that will provide a suitable separation between them and major noise sources;

(4) Generally prohibit HUD support for new construction of noise sensitive uses on sites having unacceptable noise exposure;

(5) Provide policy on the use of structural and other noise attenuation measures where needed; and

(6) Provide policy to guide implementation of various HUD programs.

(b) *Authority.* Specific authorities for noise abatement and control are contained in:

(1) The Noise Control Act of 1972 (Pub. L. 92-574) which directs Federal agencies to administer their programs in ways which reduce noise pollution.

(2) The Quiet Communities Act of 1978 (Pub. L. 95-609) which amended Pub. L. 92-574.

(3) The General Services Administration, Federal Management Circular 75-2: *Compatible Land Uses at Federal Airfields* prescribes the Executive Branch's general policy with respect to achieving compatible land uses on either public or privately owned property at or in the vicinity of Federal airfields.

(4) Section 1113 of the Housing and Urban Development Act of 1965 (Pub. L. 89-117) directs the Secretary "* * * to determine feasible methods of reducing the economic loss and hardships suffered by homeowners as a result of the depreciation in the value of their properties following the construction of airports in the vicinity of their homes, including a study of feasible methods of insulating such homes from the noise of aircraft."

§51.101 General policy.

(a) It is HUD's general policy to provide minimum national standards applicable to HUD programs to protect citizens against excessive noise in their communities and places of residence.

(1) *Comprehensive planning assistance.* HUD requires that grantees give adequate consideration to noise exposures and sources of noise as an integral part of the urban environment in HUD assisted comprehensive planning, as follows:

(i) Particular emphasis shall be placed on the importance of compatible land use planning in relation to airports, highways and other sources of high noise.

(ii) Applicants shall take into consideration HUD environmental standards impacting the use of land as required in 24 CFR Part 600.

(iii) Environmental studies, including noise assessments, are allowable costs.

(2) *Community Development Block Grants.* Recipients of community development block grants under the Housing and Community Development Act of 1974 (Pub. L. 93-383), as amended by the Housing and Community Development Act of 1977 (Pub. L. 95-128), must take into

---

This regulation replaces HUD Circular 1390.2, Noise Abatement and Control, 1971, which is now cancelled, along with all instructions and clarifying memoranda pertaining to the circular.

MV00170454

consideration the noise criteria and standards in the environmental review process and consider ameliorative actions when noise sensitive land development is proposed in noise exposed areas. Grant recipients shall address deviations from the standards in their environmental reviews as required in 24 CFR Part 58.

Where CDBG activities are planned in a noisy area, and HUD assistance is contemplated later for housing and/or other noise sensitive activities, the CDBG grantee risks denial of the HUD assistance unless the HUD standards are met. Environmental studies, including noise assessments, are allowable costs.

(3) *HUD support for new construction.* HUD assistance for the construction of new noise sensitive uses is prohibited generally for projects with Unacceptable noise exposures and is discouraged for projects with Normally Unacceptable noise exposure. (Standards of acceptability are contained in §51.103(c).) This policy applies to all HUD programs providing assistance, subsidy or insurance for housing, college housing, mobile home parks, nursing homes, hospitals, and all programs providing assistance or insurance for land development, new communities, redevelopment or any other provision of facilities and services which are directed to make land available for housing or noise sensitive development. The policy does not apply to research demonstration projects which do not result in new construction or reconstruction, flood insurance, interstate land sales registration, or any action or emergency assistance under disaster assistance programs which are provided to save lives, protect property, protect public health and safety, remove debris and wreckage, or assistance provided that has the effect of restoring facilities substantially as they existed prior to the disaster.

(4) *HUD support for existing construction.* Noise exposure by itself will not result in the denial of HUD support for the resale and purchase of otherwise acceptable existing buildings. However, environmental noise is a marketability factor which HUD will consider in determining the amount of insurance or other assistance that may be given.

The old definition of major or substantial rehabilitation and modernization as being any project where cost is 75% or more of replacement cost no longer applies. Now the criteria contained in individual program guidance applies.

Existing construction means units which are either more than 1 year old or for which this is the second or subsequent purchaser.

(5) *HUD support of modernization and rehabilitation.* For modernization projects located in all noise exposed areas, HUD shall encourage noise attenuation features in alterations. For major or substantial rehabilitation projects in the Normally Unacceptable and Unacceptable noise zones, HUD actively shall seek to have project sponsors incorporate noise attenuation features, given the extent of the rehabilitation being undertaken and the level of exterior noise exposure. In Unacceptable noise zones, HUD shall strongly encourage conversion of noise-exposed sites to land uses compatible with the high noise levels.

(6) *Research, guidance and publications.* HUD shall maintain a continuing program designed to provide new knowledge of noise abatement and control to public and private bodies, to develop improved methods for anticipating noise encroachment, to develop noise abatement measures through land use and building construction practices, and to foster better understanding of the consequences of noise. It shall be HUD's policy to issue guidance documents periodically to assist HUD personnel in assigning an acceptability category to projects in accordance with noise exposure standards, in evaluating noise attenuation measures, and in advising local agencies about noise abatement strategies. The guidance documents shall be updated periodically in accordance with advances in the state-of-the-art.

(7) *Construction equipment, building equipment and appliances.* HUD shall encourage the use of quieter construction equipment and methods in population centers, the use of quieter equipment and appliances in buildings, and the use of appropriate noise abatement techniques in the design of residential structures with potential noise problems.

MV00170455

(8) *Exterior noise goals.* It is a HUD goal that exterior noise levels do not exceed a day-night average sound level of 55 decibels. This level is recommended by the Environmental Protection Agency as a goal for outdoors in residential areas. The levels recommended by EPA are not standards and do not take into account cost or feasibility. For the purposes of this regulation and to meet other program objectives, sites with a day-night average sound level of 65 and below are acceptable and are allowable (see Standards in §51.103(c)).

(9) *Interior noise goals.* It is a HUD goal that the interior auditory environment shall not exceed a day-night average sound level of 45 decibels. Attenuation measures to meet these interior goals shall be employed where feasible. Emphasis shall be given to noise sensitive interior spaces such as bedrooms. Minimum attenuation requirements are prescribed in §51.104(a).

(10) *Acoustical privacy in multifamily buildings.* HUD shall require the use of building design and acoustical treatment to afford acoustical privacy in multifamily buildings pursuant to requirements of the Minimum Property Standards.

The Noise Control Act of 1972 required EPA to "publish information on the levels of environmental noise. . .which. . .are requisite to protect the public health and welfare with an adequate margin of safety." EPA has interpreted this to mean that the levels should not reflect technical feasibility or economic costs. "Health and welfare" is defined as being "complete physical, mental and social well-being and not merely the absence of disease and infirmity."

§51.102 Responsibilities.

(a) *Authority to approve projects.* (1) Decisions on proposed projects with acceptable noise exposures shall be delegated to the program personnel within field offices, including projects where increased noise levels are considered acceptable because of non-acoustic benefits under §51.105(a). Field office program personnel may also approve projects in normally unacceptable noise exposed areas where adequate sound attenuation is provided and where the project does not require an Environmental Impact Statement under §51.104(b).

(2) Other approvals in normally unacceptable noise exposed areas require the concurrence of the Regional Administrator.

(3) Requests for approvals of projects or portions of projects with unacceptable noise exposures shall be referred through the Regional Office to the Assistant Secretary for Community Planning and Development for approval pursuant to §51.104(b).

(4) In cases where the Regional Administrator determines that an important precedent or issue is involved, such cases shall be referred with recommendations to the Assistant Secretary for Community Planning and Development.

(b) *Surveillance of noise problem areas.* Appropriate field staff shall maintain surveillance of potential noise problem areas and advise local officials, developers, and planning groups of the unacceptability of sites because of noise exposure at the earliest possible time in the decision process. Every attempt shall be made to insure that applicants' site choices are consistent with the policy and standards contained herein.

(c) *Notice to applicants.* At the earliest possible stage, HUD program administrators shall:

(1) Determine the suitability of the acoustical environment of proposed projects;

(2) Notify applicants of any adverse or questionable situations; and

(3) Assure that prospective applicants are apprised of the standards contained herein so that future site choices will be consistent with these standards.

(d) *Technical assistance.* Technical assistance in the measurement, estimation, interpretation, or prediction of noise exposure is available from the Office of Community Planning and Development and the Office of Policy Development and Research. Field office questions shall be forwarded through the Regional Office to the Assistant Secretary for Community Planning and Development or his designee.

(e) *Interdepartmental coordination.* Regional Administrators shall foster appropriate coordination between field offices and other departments and agencies, particularly the Environmental Protection Agency, the Department of Transportation, Department of Defense representatives, and the Veterans Administration. HUD staff shall utilize the acceptability standards in commenting on the prospective impacts of transportation facilities and other noise generators in the Environmental Impact Statement review process.

MV00170456

§51.103 Criteria and standards.

These standards apply to all programs as indicated in §61.101.

(a) *Measure of external noise environments.* The magnitude of the external noise environment at a site is determined by the value of the day-night average sound level produced as the result of the accumulation of noise from all sources contributing to the external noise environment at the site. Day-night average sound level, abbreviated as DNL and symbolized as L_{dn}, is the 24-hour average sound level, in decibels, obtained after addition of 10 decibels to sound levels in the night from 10 p.m. to 7 a.m. Mathematical expressions for average sound level and day-night average sound level are stated in the Appendix.

(b) *Loud impulsive sounds.* On an interim basis, when loud impulsive sounds, such as explosions or sonic booms, are experienced at a site, the day-night average sound level produced by the loud impulsive sounds alone shall have 8 decibels added to it in assessing the acceptability of the site (see Appendix). Alternatively, the C-weighted day-night average sound level (L_{Cdn}) may be used without the 8 decibel addition, as indicated in Section 51.106(a)(3).

Methods for assessing the contribution of loud impulsive sounds to day-night average sound level at a site and mathematical expressions for determining whether a sound is classed as "loud impulsive" are provided in the Appendix.

(c) *Exterior standards.* The degree of acceptability of the noise environment at a site is determined by the sound levels external to buildings or other facilities containing noise sensitive uses. The standards shall usually apply at a location 2 meters (6.5 feet) from the building housing noise sensitive activities in the direction of the predominant noise source. Where the building location is undetermined, the standards shall apply 2 meters (6.5 feet) from the building setback line nearest to the predominant noise source. The standards shall also apply at other locations where it is determined that quiet outdoor space is required in an area ancillary to the principal use on the site.

The noise environment inside a building is considered acceptable if (a) the noise environment external to the building complies with these standards, and (b) the building is constructed in a manner common to the area or, if of uncommon construction, has at least the equivalent noise attenuation characteristics.

This is because the reverberation effect of sound waves hitting the wall will increase the noise levels at the site. You won't pick this up unless you back off from the wall to measure.

Site Acceptability Standards

	Day-night average sound level (in decibels)	Special approvals and requirements
Acceptable	Not exceeding 65 dB(1)	None
Normally Unacceptable	Above 65 dB but not exceeding 75 dB	Special Approvals (2) Environmental Review (3) Attenuation (4)
Unacceptable	Above 75 dB	Special Approvals (2) Environmental Review (3) Attenuation (5)

Notes.—(1) Acceptable threshold may be shifted to 70 dB in special circumstances pursuant to Section 51.105(a)

(2) See Section 51.104(b) for requirements.

(3) See Section 51.104(b) for requirements.

(4) 5 dB additional attenuation required for sites above 65 dB but not exceeding 70 dB and 10 dB additional attenuation required for sites above 70 dB but not exceeding 75 dB. (See Section 51.104(a).)

(5) Attenuation measures to be submitted to the Assistant Secretary for CPD for approval on a case-by-case basis.

MV00170457

§51.104 Special requirements.

(a) *Noise attenuation.* Noise attenuation measures are those required in addition to attenuation provided by buildings as commonly constructed in the area, and requiring open windows for ventilation. Measures that reduce external noise at a site shall be used wherever practicable in preference to the incorporation of additional noise attenuation in buildings. Building designs and construction techniques that provide more noise attenuation than typical construction may be employed also to meet the noise attenuation requirements.

(1) *Normally Unacceptable noise zone.* Approvals in this zone require a minimum of 5 decibels additional sound attenuation for buildings having noise-sensitive uses if the day-night average sound level is greater than 65 decibels but does not exceed 70 decibels, or a minimum of 10 decibels of additional sound attenuation if the day-night average sound level is greater than 70 decibels but does not exceed 75 decibels.

(2) *Unacceptable noise zone.* Noise attenuation measures require the approval of the Assistant Secretary for Community Planning and Development (See §51.104(b)(2).)

(b) *Special Approvals and Environmental Review Requirements.* Environmental clearances shall be conducted pursuant to the requirements of HUD's Departmental Policies, Responsibilities and Procedures for Protection and Enhancement of Environmental Quality (38 FR 19182 as amended) or other environmental regulations which may be issued by the Department. The Special Clearance and Environmental Impact Statement (EIS) threshold requirements are hereby modified for all projects proposed in the Normally Unacceptable and Unacceptable noise exposure zones as follows:

(1) *Normally Unacceptable noise zone.* (i) All projects located in the Normally Unacceptable Noise Zone require a Special Environmental Clearance except an EIS is required for a proposed project located in a largely undeveloped area, or where the HUD action is likely to encourage the establishment of incompatible land use in this noise zone.

Berms and barriers are our first choice because they provide protection for yards, playgrounds, etc. Since outdoor activity is often very important to residents we want to protect the outdoor areas as much as possible.

By definition a barrier must be separate from the building or area it is providing attenuation for. After all barriers are preferred because they improve exterior as well as interior levels. Non-noise sensitive buildings can, however, be used as barriers for noise sensitive buildings or exterior areas.

Assumption is that standard construction provides an average of 20 L_{dn} attenuation. At 65 L_{dn} or below this amount of attenuation would be sufficient to meet interior level of 45 L_{dn}. Additional requirements are designed to meet this goal even when exterior noise levels are higher.

Substitute Environmental Assessment (with ECO concurrence) wherever you see Special Clearance.

MV00170458

(ii) When an EIS is required, the concurrence of the Regional Administrator is also required before a project can be approved. For the purposes of this paragraph, an area will be considered as largely undeveloped unless the area within a 2-mile radius of the project boundary is more than 50 percent developed for urban uses and infrastructure (particularly water and sewers) is available and has capacity to serve the project.

(iii) All other projects in the Normally Unacceptable zone require a Special Environmental Clearance, except where an EIS is required for other reasons pursuant to HUD environmental policies.

(2) *Unacceptable noise zone.* An EIS is required prior to the approval of projects with unacceptable noise exposure. Projects in or partially in an Unacceptable Noise Zone shall be submitted through the Regional Administrator to the Assistant Secretary for Community Planning and Development for approval. The Assistant Secretary may waive the EIS requirement in cases where noise is the only environmental issue and no outdoor sensitive activity will take place on the site. In such cases, a Special Environmental Clearance is required.

When the area in question is in a small community outside an SMSA and the application of the 2 mile radius rule would be unreasonable, an area can be considered largely developed if it is contiguous to existing development and infrastructure is available and has capacity to serve the project. The Assistant Secretary will review them on a case-by-case basis. In all other cases the 2 mile radius/50% rule still applies.

§51.105 Exceptions.

(a) *Flexibility for non-acoustic benefits.* Where it is determined that program objectives cannot be achieved on sites meeting the acceptability standard of 65 decibels, the Acceptable Zone may be shifted to L_{dn} 70 on a case-by-case basis if all the following conditions are satisfied:

(1) The project does not require an Environmental Impact Statement under provisions of section 104(b)(1) and noise is the only environmental issue.

(2) The project has received a Special Environmental Clearance and has received the concurrence of the Environmental Clearance Officer.

(3) The project meets other program goals to provide housing in proximity to employment, public facilities and transportation.

(4) The project is in conformance with local goals and maintains the character of the neighborhood.

(5) The project sponsor has set forth reasons, acceptable to HUD, as to why the noise attenuation measures that would normally be required for new construction in the L_{dn} 65 to L_{dn} 70 zone cannot be met.

Caution—every effort should be made to get official contours—particularly for military installations and large air carrier airports rather than trying to use the *Noise Assessment Guidelines.*

What this really means is that the 5db attenuation requirement for the 65–70 L_{dn} zone is waived. Primarily intended for urban areas where alternative sites are not available. Note that *all* conditions must be met.

(6) Other sites which are not exposed to noise above L_{dn} 65 and which meet program objectives are generally not available.

The above factors shall be documented and made part of the project file.

§51.106 Implementation.

(a) *Use of available data.* HUD field staff shall make maximum use of noise data prepared by others when such data are determined to be current and adequately projected into the future and are in terms of the following:

(1) *Sites in the vicinity of airports.* The noise environment around airports is described sometimes in terms of Noise Exposure Forecasts, abbreviated as NEF or, in the State of California, as Community Noise Equivalent Level, abbreviated as CNEL. The noise environment for sites in the vicinity of airports for which day-night average sound level data are not available may be evaluated from NEF or CNEL analyses using the following conversions to DNL:

DNL ≈ NEF + 35

DNL ≈ CNEL

(2) *Sites in the vicinity of highways.* Highway projects receiving Federal aid are subject to noise analyses under the procedures of the Federal Highway Administration.

Where such analyses are available they may be used to assess sites subject to the requirements of this standard. The Federal Highway Administration employs two alternate sound level descriptors: (a) The A-weighted sound level not exceeded more than 10 percent of the time for the highway design hour traffic flow, symbolized as L_{10}; or (b) the equivalent sound level for the design hour, symbolized as L_{eq}. The day-night average sound level may be estimated from the design hour L_{10} or L_{eq} values by the following relationships, provided heavy trucks do not exceed 10 percent of the total traffic flow in vehicles per 24 hours and the traffic flow between 10 p.m. and 7 a.m. does not exceed 15 percent of the average daily traffic flow in vehicles per 24 hours:

DNL ≈ L_{10} (design hour)—3 decibels

DNL ≈ L_{eq} (design hour) decibels

Where the auto/truck mix and time of day relationships as stated in this Section do not exist, the HUD Noise Assessment Guidelines or other noise analysis shall be used.

These requirements are very important. Be careful with design hour values.

MV00170459

(3) *Sites in the vicinity of installations producing loud impulsive sounds.* Certain Department of Defense installations produce loud impulsive sounds from artillery firing and bombing practice ranges. Noise analyses for these facilities sometimes encompass sites that may be subject to the requirements of this standard. Where such analyses are available they may be used on an interim basis to establish the acceptability of sites under this standard.

The Department of Defense uses day-night average sound level based on C-weighted sound level, symbolized L_{Cdn}, for the analysis of loud impulsive sounds. Where such analyses are provided, the 8 decibel addition specified in 51.103(b), is not required, and the same numerical values of day-night average sound level used on an interim basis to determine site suitability for non-impulsive sounds apply to the L_{Cdn}.

(4) *Use of areawide acoustical data.* HUD encourages the preparation and use of areawide acoustical information, such as noise contours for airports. Where such new or revised contours become available for airports (civil or military) and military installations they shall first be referred to the Regional Office (Environmental Clearance Officer) for review, evaluation and decision on appropriateness for use by HUD. The Regional Office shall submit revised contours to the Assistant Secretary of Community Planning and Development for review, evaluation and decison whenever the area affected is changed by 20 percent or more, or whenever it is determined that the new contours will have a significant effect on HUD programs, or whenever the contours are not provided in a methodology acceptable under §51.106(a)(1) or in other cases where the Regional Office determines that Headquarters review is warranted. For other areawide acoustical data, review is required only where existing areawide data are being utilized and where such data have been changed to reflect changes in the measurement methodology or underlying noise source assumptions.

Contours for future noise levels based on new construction, mission changes etc. which become available as part of the Environmental Impact Statement process shall not be used until the NEPA process is complete and a decision on the proposed action is made.

When new or revised contours are approved, make sure all interested people in local area are informed that HUD will be using different contours. Make a special effort to inform the most active developers in area or developers who have worked with HUD before.

This is also required for noise studies for developers by consultants, whether to provide original data, or to contest existing data or a HUD analysis. It is particularly important to make sure the same traffic, vehicle or operational data were used for each study, when one study is being contested.

Requests for determination on usage of new or revised areawide data shall include the following:

(i) Maps showing old, if applicable, and new noise contours, along with brief description of data source and methodology.

(ii) Impact on existing and prospective urbanized areas and on development activity.

(iii) Impact on HUD-assisted projects currently in processing.

(iv) Impact on future HUD program activity. Where a field office has determined that immediate approval of new areawide data is necessary and warranted in limited geographic areas, the request for approval should state the circumstances warranting such approval. Actions on proposed projects shall not be undertaken while new areawide noise data are being considered for HUD use except where the proposed location is affected in the same manner under both the old and new noise data.

(b) *Site assessments.* Compliance with the standards contained in §51.103(c) shall, where necessary, be determined using noise assessment guidelines, handbooks, technical documents and procedures issued by the Department.

(c) *Variations in site noise levels.* In many instances the noise environment will vary across a site, with portions of the site being in an Acceptable noise environment and other portions in a Normally Unacceptable noise environment. The standards in §51.103(c) shall apply to the portions of a building or buildings used for residential purposes and for ancillary noise sensitive open spaces.

(d) *Noise measurements.* Where noise assessments result in a finding that the site is borderline or questionable, or is controversial, noise measurements may be performed. Where it is determined that noise measurements are required, such measurements will be conducted in accordance with methods and measurement criteria established by the Department. Locations for noise measurements will depend on the location of noise sensitive uses that are nearest to the predominant noise source (see §51.103(c)).

MV00170460

(e) *Projections of noise exposure.* In addition to assessing existing exposure, future conditions should be projected. To the extent possible, noise exposure shall be projected to be representative of conditions that are expected to exist at a time at least 10 years beyond the date of the project or action under review.

When projections for airports are based on new construction or similar actions the likelihood that such major action will actually take place should be carefully evaluated. This is particularly important if local funding is required. Check to see if initial actions such as land purchases, bonds etc. been taken. If projections are just based on expanded traffic levels make sure they are reasonable for the area. Projections for smaller communities are often overly optimistic.

(f) *Reduction of site noise by use of berms and/or barriers.* If it is determined by adequate analysis that a berm and/or barrier will reduce noise at a housing site, and if the barrier is existing or there are assurances that it will be in place prior to occupancy, the environmental noise analysis for the site may reflect the benefits afforded by the berm and/or barrier.

This provision should be used with caution. Very clear and strong assurances that berms or barriers will be constructed should be obtained in writing before approval.

Again also note that by definition a barrier must be physically separate from the building or area it is providing attenuation for.

In the environmental review process under §51.104(b), the location height and design of the berm and/or barrier shall be evaluated to determine its effectiveness, and impact on design and aesthetic quality, circulation and other environmental factors.

The *Noise Assessment Guidelines* contain procedures for evaluating barrier effectiveness.

Appendix to Subpart B—definition of acoustical quantities

1. *Sound Level.* The quantity in decibels measured with an instrument satisfying requirements of American National Standard Specification for Type 1 Sound Level Meters S1.4-1971. Fast time-averaging and A-frequency-weighting are to be used, unless others are specified. The sound level meter with the A-weighting is progressively less sensitive to sounds of frequency below 1,000 hertz (cycles per second), somewhat as is the ear. With fast time averaging the sound level meter responds particularly to recent sounds almost as quickly as does the ear in judging the loudness of a sound.

(2) *Average Sound Level.* Average sound level, in decibels, is the level of the mean-square A-weighted sound pressure during the stated time period, with reference to the square of the standard reference sound pressure of 20 micropascals.

$$L_{dn} = 10 \log_{10} \left[\frac{1}{86400} \left(\int_{0000}^{0700} 10^{[L_A(t)+10]/10}\, dt + \int_{0700}^{2200} 10^{L_A(t)/10}\, dt + \int_{2200}^{2400} 10^{[L_A(t)+10]/10}\, dt \right) \right]$$

MV00170461

Time t is in seconds, so the limits shown in hours and minutes are actually interpreted in seconds. $L_A(t)$ is the time varying value of A-weighted sound level, the quantity in decibels measured by an instrument satisfying requirements of American National Standard Specification for Type 1 Sound Level Meters S1.4–1971.

3. *Loud Impulsive Sounds.* When loud impulsive sounds such as sonic booms or explosions are anticipated contributors to the noise environment at a site, the contribution to day-night average sound level produced by the loud impulsive sounds shall have 8 decibels added to it in assessing the acceptability of a site.

A loud impulsive sound is defined for the purpose of this regulation as one for which:

(i) The sound is definable as a discrete event wherein the sound level increases to a maximum and then decreases in a total time interval of approximately one second or less to the ambient background level that exists without the sound; and

(ii) The maximum sound level (obtained with slow averaging time and A-weighting of a Type 1 sound level meter whose characteristics comply with ANSI S1.4–1971) exceeds the sound level prior to the onset of the event by at least 6 decibels; and

(iii) The maximum sound level obtained with fast averaging time of a sound level meter exceeds the maximum value obtained with slow averaging time by at least 4 decibels.

Issued at Washington, D.C., on July 5, 1979.

Patricia Roberts Harris,
Secretary of Housing and Urban Development.

Quiz on the Noise Regulations

Questions

1. What is the HUD policy on support for existing constructon in high noise areas?
2. What is the definition of "major or substantial rehabilitation"?
3. What is HUD's Interior noise goal?
4. What project approval authority does the Field Office have?
5. Who approves projects in the Unacceptable Zone?
6. What noise descriptor is used to express noise levels in the regulation?
7. How are loud impulsive sounds to be evaluated?
8. At what point on a building's exterior are sound levels to be determined?
9. What is the basic assumption behind the attenuation levels required?
10. What type of attenuation measures are preferred?
11. When should building attenuation measures be considered?
12. When are EIS's required?
13. When is an area considered "largely undeveloped"?
14. What is "Flexibility for Non-Acoustic Benefits"?
15. Six conditions are listed for waiving the attenuation requirement under the Flexibility for Non-Acoustic Benefits provision, how many must be met for the waiver to be granted?
16. Who has the authority to grant the attenuation requirements waiver under the "flexibility" provision?
17. What noise descriptors other than DNL are acceptable for aircraft noise contours?
18. Who normally approves areawide noise data such as airport noise contours?
19. If a site is partially in the Unacceptable Zone and partially in the Normally Unacceptable Zone, which review and approval procedures apply?
20. When should noise measurements be used in lieu of areawide data or *Noise Assessment Guidelines* calculations?

Quiz on the Noise Regulations

Answers

1. Noise exposure can not, by itself, be the basis for denying support for resale and purchase of existing buildings. (Section 51.101(a)(4))
2. "Major or substantial rehabilitation" is defined in individual program guidance. There is no single definition. (51.101(a)(5) marginal note)
3. 45 L_{dn} (Section 51.101(a)(9))
4. projects in Acceptable Zone; also projects in Normally Unacceptable Zone provided that
   - adequate sound attenuation is provided
   - no EIS is required

   (Section 51.102(a)(1))
5. The Assistant Secretary for Community Planning and Development. (Section 51.102(A)(3) and 51.104(b))
6. The day night average sound level system (DNL). (Section 51.103(a))
7. Two ways:
   - If plain DNL levels have been calculated or measured, add a 8 decibel penalty.
   - Alternatively, the C weighted day night average sound level system (L_{Cdn}) can be used as is. (Section 51.103(b))
8. Two meters (6.5 feet) away from the building exterior, moving towards the predominant noise source. (Section 51.103(c))
9. That current construction practices provide about 20 db attenuation. Thus in a 65 L_{dn} or lower area the interior goal of 45 L_{dn} would be met with standard construction. The additional attenuation required is the increment over that provided by standard construction necessary to achieve the interior goal of 45 L_{dn}. (Section 51.104(a) marginal note)
10. Measures which reduce **exterior** noise levels. (51.104(a))
11. Only after it has been determined that berms and barriers or site redesign are not practical alternatives. (Section 51.104(a))
12. When the project is located in the Unacceptable Zone or the project is located in a largely undeveloped area and the project is in the Normally Unacceptable Zone. (Section 51.104(b))
13. When the area within a 2 mile radius of the project is less than 50% developed for urban uses and infrastructure is not in place and available to serve the project. (Section 51.104(b)(1)(ii))
14. A provision in the regulations which allows the attenuation requirements for the 65–70 L_{dn} zone to be waived. (Section 51.105(a) and marginal note)
15. All six conditions must be met. (Section 51.105(a))
16. The field office. (Section 51.102(a))
17. NEF and CNEL. (Section 51.106(a)(1))
18. The Regional Office. (Section 51.106(a)(4))
19. The review and approval procedures for projects in the Unacceptable Zone apply. (Section 51.104(b)(2))
20. Only when the noise assessment indicates that the site is on the borderline between Acceptable and Unacceptable, or when the site is controversial. (Section 51.106(d))

MV00170462

Chapter 3

Major Policy and Implementation Questions Related to the Noise Regulation

As regulations are applied in the field, it is inevitable that questions will arise. It is, after all, very difficult to anticipate every situation when preparing a regulation. Sometimes the questions relate to specific and unique situations of limited interest to anyone but the office involved. Other questions, however, raise issues of more general concern. In this section we have brought together the most important and most relevant questions that have arisen since the noise regulation went into effect in August of 1979. We have used a question and answer format for your convenience.

The following are the topics included:

1. Noise projections for civil airports
2. Definition of infill for small towns
3. Areawide EIS waivers
4. Requirements for modernization and rehabilitation projects
5. Use of berms and barriers as attenuation measures
6. New and revised airport noise contours

Questions and Answers

1. How valid and useful are civil airport noise projections that show significant reductions in the amount of land exposed to high noise levels? Should we be suspicious?

Contours that show significant reductions in the area exposed to high noise levels may seem questionable, but, according to the Environmental Protection Agency, they may be quite accurate. The EPA does expect to see some significant reductions in the number of people exposed to high levels of aircraft noise over the next 15 years. In their report *Aviation Noise: The Next Twenty years*, EPA stated that they expected to see the number of people exposed to levels of 65 Ldn or greater to drop from a 1975 figure of 5,550,000 to about 2,650,000 in the year 2000. Much of this reduction would occur during the period 1980–1985 with more modest decreases thereafter. The reductions are expected to result from the Federal Aviation Administration's current noise certification requirements, even with up to 100% increases in aircraft operations. (Current certification requirements are for all new aircraft to achieve stage three noise levels and all older aircraft to achieve stage two levels by 1985. Progress has been good in meeting these requirements.)

In general then, you should not be surprised to see significant reductions in contour size if the following conditions are met:

- the decrease in size is no more than 50%;
- the increase in operations is no more than 100%; and
- FAR stage 3 aircraft, such as the B757 and B767, are included in the fleet mix, but not to the total exclusion of all other aircraft.

Assuming that the contours are otherwise technically correct, significantly smaller contours should be acceptable.

2. Many small towns aren't big enough for a project to meet the definition of infill contained in section 51.104 (b)(1)(ii). However, a project located in the heart of town can hardly be considered to be in a largely undeveloped area. Must an EIS be prepared?

Not necessarily. If the jurisdiction in which the project is located is not part of a standard metropolitan area, a project may be considered infill if it is within or contiguous to the already developed area and infrastructure (particularly water and sewer) is available and has the capacity to serve the project. It must also be clear that the project will not encourage the establishment of other incompatible land uses in the normally unacceptable noise zone.

If you believe a project meets these criteria, submit documentation to the Office of Environment and Energy for their review and determination.

3. What can we do to reduce the procedural burden when, for a variety of reasons, the Department expects to be considering a number of projects in an unacceptable noise zone? Most of the projects would probably qualify for an EIS waiver, but how can we avoid filling repetitive, individual requests?

While the number of cases where the Department would be seriously considering a number of projects exposed to unacceptable noise levels in the same jurisdiction is likely to be limited, there is an alternative to individual processing in those situations. The alternative is to issue an areawide waiver for the entire affected jurisdiction. Such a waiver can be useful when the unacceptable noise zone heavily impacts a substantially developed community with limited site alternatives. (In most cases we would expect that the noise source would be aircraft, but in very small towns it is possible that a heavily used rail line could create a large unacceptable noise zone.)

An areawide EIS waiver would, of course, have to have a more detailed environmental assessment than an individual project request, and there are other special processing steps.

MV00170463

But if you have a situation where you think the Department has a good reason to expect to process a number of projects within the unacceptable noise zone, there is an alternative to individual EIS waivers. Contact the Office of Environment and Energy for details on how to request the areawide waiver.

4. What exactly are the processing requirements and general policies for modernization and rehabilitation projects? Does secton 51.104 apply to them as well as to new construction? The noise regulation is a bit confusing on this.

Yes, the noise regulation is a bit confusing on this question. We have seen several instances where field offices have mistakenly applied the provisions of Section 51.104 to modernization and rehabilitation projects. We believe that this happens because section 51.104 is not as clearly titled as it might have been. It would be better if it read "special requirements for new construction" rather than simply "special requirements".

The only parts of the regulation that apply to modernization and rehabilitation projects are sections 51.101 (a)(5) and the definitions of normally unacceptable and unacceptable noise zones contained in the table in section 51.103. None of the other proessing or policy provisions of the table or of sections 51.102 and 51.104 apply. Therefore:

- modernization and rehabilitation projects are to be processed by the field offices regardless of the noise zone.
- EIS's are not required for modernization and rehabilitation projects unless mandated by other applicable environmental regulations.

You must however continue to encourage attenuation features in modernization and rehabilitation projects, in accordance with the general policy stated in section 51.101(a)(5).

5. We know that berms and barriers are the preferred type of noise attenuation because of the protection they provide for outdoor living areas, but we need some further guidance on when they are really the best choice.

While barriers can be an effective noise attenuation technique, they must, indeed, be used with caution and common sense because they can create more problems than they solve. Very high noise barriers can create significant aesthetic and financial problems relative to the noise benefit to be achieved. Barriers can block light, hinder natural ventilation, create an unpleasant sense of being walled in, and can be very unattractive. In addition, barriers do require continuing maintenance and can be very costly to build.

It is important to remember that the noise regulation says that "measures that reduce external noise at a site shall be used **wherever practicable.**" Is it practicable to propose a 20 foot high barrier only 15 feet from the rear of a two-story building? Granted it would certainly protect the building from noise, but what about the blocked light, the reduced ventilation, the visual impact, and the cost? The purpose of a barrier is primarily to reduce the noise levels in those outdoor areas that people use. The secondary purpose is to reduce the need for structural attenuation. Therefore, the barrier should only be as high as is necessary to protect those areas. Structural attenuation should be required for the parts of the building not protected by the barrier. And if there aren't any outdoor areas where low noise levels are important, barriers shouldn't be required unless they would be more cost effective than building attenuation measures.

6. What should we be doing once we have processed new or revised aircraft noise contours and they have been approved for use?

The most important thing you can do once new or revised aircraft noise contours have been approved for use is to tell the people who are most likely to be affected by the change. If you have a newsletter that you regularly publish, that is one way to get the word out. At the very least you should specifically notify the affected jurisdictions and the builders/developers who are known to be active in the vicinity of the noise impacted areas. Make sure you notify builders and developers who have large scale projects that you have been processing in sections. Go back and check your files to find them. Even though you should have done an overall environmental review of the project at the time the first section was submitted, the approval of individual sections is dependent on the noise levels at the time that section is submitted.

MV00170464

Chapter 4

Noise Attenuation

Introducton

HUD's noise policy (24 CFR 51B) clearly requires that noise attenuation measures be provided when proposed projects are to be located in high noise areas. The requirements set out in Section 51.104(a) are designed to insure that interior levels do not exceed the 45 L_{dn} level established as a goal in Section 51.101(a)(9). Thus, in effect, if the exterior noise level is 65 L_{dn} to 70 L_{dn}, 25 db of noise attenuation must be provided; if the exterior noise level is between 70 and 75 L_{dn}, then 30 db of attenuation is required. Likewise, for projects proposed for areas where noise levels exceed 75 L_{dn}, sufficient attenuaton must be provided to bring interior levels down to 45 L_{dn} or below.

There are three basic ways to provide the noise attenuation required:

1. the use of barriers or berms
2. site design
3. acoustical construction

Of these, only the first two provide any improvement in the exterior environment. Because HUD considers a quiet exterior environment to be important, we prefer the use of those measures that reduce exterior levels as well as interior levels. The use of acoustical construction by itself is, therefore, the least preferred alternative since it only affects the interior levels. While we recognize that in many cases barriers or site design cannot provide all the attenuation necessary, you should combine them with acoustical construction whenever possible.

Your responsibility as a HUD staff member is to:

- make sure the project sponsor or developer is aware of the attenuation requirements for the project.
- make the sponsor aware of the options available

and

- review attenuation proposals to make sure they are adequate.

While it is not your responsibility to provide detailed design assistance to the sponsor or developer, you should know enough about the attenuation options to give him or her a basic understanding of what must be done. In many cases, you may be able to reassure the sponsor or developer that the necessary attenuation can be achieved through the use of common construction techniques or materials. Or you may be able to point out how a simple site design change can achieve the desired result without additional cost.

The following sections are designed to provide you with the information you will need to fulfill your responsibilities. Each attenuation approach is discussed both in terms of basic concepts and in terms of what to look for in reviewing attenuation proposals. The discussion does assume that you have a working knowledge of the *Noise Assessment Gujidelines*. If you have not worked with the *Guidelines* before or not recently you may want to go back and review them, particularly the section on calculating the effects of barriers.

Barrier Noise Reduction Concepts

(The following, with some editing and with some additional graphics, is taken from the Federal Highway Administration's *Noise Barrier Design Handbook*.[1])

When no obstacles are present between [a source] and adjoining areas, sound travels by a **direct** path from the "sources"... to [the] "receivers"..., as shown in Figure 1. Introduction of a barrier between the source and receiver redistributes the sound energy into several [indirect] paths: a **diffracted** path, over the top of the barrier; a **transmitted** path, through the barrier; and a **reflected** path, directed away from the receiver. These paths are also illustrated in Figure 1.

[1] *Noise Barrier Design Handbook* US Department of Transportation, Federal Highway Administration, February 1976. (FHWA-RD-76-58).

Figure 1
Alteration of Noise Paths by a Barrier

MV00170465

Barrier Diffraction and Attenuation

Consider an infinitely long, infinitely massive noise barrier placed between a highway and the receiver. Figure 2 illustrates a cross-section through such a configuration. [In] this example, the only way that sound can reach the receiver is by bending over the top of the barrier; as shown in the figure. The bending of sound waves in this manner over an obstacle is known as diffraction. The area in which diffraction occurs behind the barrier is known as the "shadow zone." The straight path from the source over the top of the barrier forms the boundary of this zone.

All receivers located in the shadow zone will experience some sound attenuation; the amount of attenuation is directly related to the magnitude of the diffraction angle ϕ. As ϕ increases, the barrier attenuation increases. The angle ϕ will increase if the barrier height increases, or if the source or receiver are placed closer to the barrier. Clearly then the barrier attenuation is a function of the geometrical relationship between the source, receiver, and barrier. One way of relating these parameters to the barrier attenuation is to define the path-length difference as shown in Figure 3. This parameter is the difference in distance that the sound must travel in diffracting over the top of the barrier rather than passing directly through it.

In the preceding discussion it was assumed that the barrier was "infinite"; i.e., long enough to shield the receiver from all sound sources up and down the highway. For short barriers, the attenuation can be seriously limited by the sound from sections of highway beyond the barrier's ends, which are unshielded from the receiver, as shown in Figure 4. Similarly, when there are large gaps in the barrier (to permit access, for example), sound from the unshielded section of highway adjacent to the gap can greatly compromise barrier attenuation, especially for those receivers close to the opening.

Figure 2
Barrier Diffraction

Figure 3
Path Length Difference $\delta = A + B - d$

Figure 4
Short-circuit of Barrier Around Ends and Through Openings

MV00170466

It should be mentioned that the use of barrier walls with sloped sides (forming angles of grater than 10–15 degrees from the vertical) will also generally eliminate multiple reflections. Use of earth berms is particularly appropriate to accomplish this. Sloped barrier walls will require more material to achieve a desired height than a vertical wall, while berms will require greater right-of-way than a thin wall.

Ground Effects

Consider again the direct path of sound from the source to receiver as illustrated in Figure 1 in the absence of any obstacles. For sources and receivers located close to the ground, in addition to this direct path sound energy may reach the receiver by reflecting off the ground. When the terrain is relatively hard and flat, such a reflection will add to the noise from the direct path to increase the level at the receiver. However, when the ground is soft, there may be a phase reversal upon reflection such that the noise from the ground reflection path will destructively interfere with the noise from the direct path resulting in a significant reduction in noise levels at the receiver.

This reduction in level, known as ground-effect attenuation, is in excess of the 3 dB per doubling of distance propagation loss for a line source of noise and occurs only above soft absorptive ground (such as normal earth and most ground with vegetation). Over hard ground (such as concrete, stone and very hard-packed earth) these effects do not occur. These effects are most apparent for receivers on the ground floor, and decrease rapidly as receiver height above ground increases.

While ground absorption effects are not completely understood, it is generally believed that these effects account for the 4.5 dB per doubling of distance propagation loss observed over soft ground, as compared to the 3 dB propagation loss observed over hard ground. The implication with regard to barrier design is that placement of a barrier over soft ground between source and receiver will re-direct the sound over the top of the barrier, thus destroying the ground reflection and the additional 1.5 dB per doubling of distance attenuation. Thus, the barrier must be designed to provide more reduction than would otherwise be necessary, to compensate for the lost ground effects over absorptive ground.

Summary

(From: *Design Guide*, National Bureau of Standards[1])

In summary, the following can be said about noise barriers.

- If a barrier does not block the line-of-sight between the source and receiver, the barrier will provide little or no attenuation.
- If a barrier is constructed of a material with a surface weight density greater than 4 lb/ft^2 and there are no openings through the barrier, transmitted sound will usually be negligible.
- If there are openings totaling over 10 percent or more of the barrier area, barrier attenuation will be negligible.
- Diffracted sound is usually the most important aspect in estimating barrier attenuation.
- Reflected sound can be important for receivers on the source side of a barrier, but it normally is not a factor for receivers on the side opposite from the source. Hence reflected sound is usually not important to your building and site.
- Transmission of sound around the ends of the barrier can be critical if the barrier included angle is less than 170°.
- Barrier attenuations greater than an A-weighted sound level difference of 10 dB are difficult to obtain.
- For two or more barriers "in series," consider only the "dominant" barrier.
- Assume no attenuation for a receiver located beyond the end of a barrier.

Reviewing Barrier Proposals

An effective barrier is one which reduces the noise level behind the barrier to 65 L_{dn} or lower. If a barrier can reduce the exterior noise level to 65 L_{dn}, then standard construction techniques should be sufficient to insure an interior level of 45 L_{dn} or below. Therefore, if you determine that a proposed barrier is adequate to reduce the exterior noise level to 65 L_{dn} then no additional attenuation measures should be necessary.

[1] *Design Guide for Reducing Transportation Noise in and Around Buildings*, US Department of Commerce, National Bureau of Standards, April 1978. (Building Science Series 84)

There are four things to check when determining the adequacy of a proposed barrier:

1. Is it high enough?
2. Is it long enough?
3. Is it made of the right materials?
4. Is it properly constructed?

Is it High Enough?

In order for a barrier to be effective it must be at least high enough to break the line of sight between the source and the receiver. In the *Noise Assessment Guidelines* you will find the procedure for determining how much attenuation is provided by a barrier of a given height.

In general, barriers and berms are most effective for one and two story buildings because a relatively low barrier can often provide the attenuation needed. The height that might be required to provide attenuation for much taller buildings is often not feasible for either cost or aesthetic reasons. However, even if a barrier can not be made high enough to attenuate the upper floors of a multistory building, it may still be able to provide some protection for outdoor recreational areas. Before discarding the barrier idea check for this possibility.

If you find that the barrier as proposed is too short to be effective but the sponsor or developer tells you that he or she can not make the barrier any higher, there are some alternatives you can suggest. There are ways to get more attenuation out of each foot of overall height.

As a general rule, barriers work better the closer they are to the source. Figure 6 shows a barrier that does not block the line of sight at all when it is located next to the receiver, yet is quite tall enough when located next to the source. Thus, if the sponsor or developer can not make the barrier any taller, perhaps he or she can move it closer to the source.

Another way to get more attenuation without increasing overall barrier height is to bend the top of the barrier towards the source. Figure 7 shows a case where a barrier built perfectly straight provides 8 dB of attenuation. A barrier with the same overall height but with a 45 degree bend towards the source provides 9.5 dB of attenuation. Thus if the project sponsor or developer wants to keep the overall height of the barrier down, he or she can still increase the attenuation provided simply by bending the top.

MV00170467

Figure 6
Effect of Moving the Barrier Closer to the Source

Figure 7
Effect of Bending the Top of the Barrier Towards the Source

Thus, if your review of a proposed barrier shows it to be too short, but it can not be made any higher, suggest that the barrier be moved closer to the source or that it be bent at the top, or both.

Is It Long Enough?

Once you have established how much attenuation the barrier provides due to its height, you must determine if the length of the barrier compromises that attenuation level. Again, *the Noise Assessment Guidelines* contain a procedure for calculating the effect of barrier length.

If you find that the barrier is too short but that there are limitations on how long it can be made, there are, as there were with barrier heights, some recommendations you can make on how to improve the effectiveness of the barrier.

Again, if you bend the edges of the barrier, this time towards the **receiver** not the source, you will increase the effectiveness of the barrier. Figure 8 shows how much a barrier's effectiveness can be improved by bending the edges.

You can also improve the effectiveness of the barrier by moving it closer to the receiver. Figure 9 shows how much a barrier's effectiveness can be increased by moving it closer to the receiver. Now obviously, this creates a conflict with what we said earlier about moving the barrier closer to the source. Clearly each case will require a different compromise. If height is not a limiting factor but length is, you might recommend to the project sponsor or developer that the barrier be moved closer to receiver and the height increased as necessary. If the reverse is true, you would want to recommend the opposite. If both height and length are limited, then the sponsor or developer must find that optimum point where the effeciveness of both the barrier height and the barrier length is as high as possible.

MV00170468

Figure 8
Effect of Bending the Edges of Barrier Towards Receiver
(Both Barriers have Potential Value of 10db)

Is It Made of The Right Materials?

Even if a barrier is high enough and long enough, its effectiveness can be severely reduced if it is made up of lightweight materials that easily transmit sound waves. In the preceding section on barrier concepts we talked about how if the transmission loss value for the barrier material was not at least 10 db higher than the attenuation value of the barrier based on length and height there would be a significant reduction in the effectiveness of the barrier.

Therefore, once you have calculated the basic attenuation potential of the barrier, you must check to make sure the proper material is being used to build the barrier. Table 1 lists the transmission loss values for materials commonly used in barrier construction. Once you have found the transmission loss value for the material being used, go to Table 2. Read down the column with the transmission loss for the material at its top and across the line that has the attenuation potential for the barrier listed. Where the two intersect you will find the actual attenuation capability of the barrier.

If you find that the choice of material has severely reduced the effectiveness of the barrier, you should recommend that the sponsor or developer select another material.

Is It Properly Constructed?

Holes or openings can substantially reduce the effectiveness of a barrier. A barrier that has openings totaling 50% or more of its total area will provide no attenuation. A barrier that has openings totaling 10% of its total area has a maximum attenuation value of approximately 4db. That is 4db no matter how high, how long or how thick the barrier. So you can see that it is very important that the barrier is made of solid materials and that it is tightly constructed. In general the intended openings in a barrier should equal no more than 1% of total area and the construction specifications should require that all joints are tightly sealed.

MV00170469

Figure 9
Effect of Moving Barrier Closer to Receiver

A Final Note

One thing should have become clear to you as you have been reading this section, and that is that in order for you to adequately review a project sponsor or developer's proposed barrier you must be given fairly specific information about the exact dimensions of the proposed barrier, the type and thickness of the barrier material, and the exact design of the barrier including construction specifications. Without this information you will be unable to do any more than a cursory evaluation, an evaluation that could be far from accurate. Make sure you make it clear to the developer or sponsor what you need to have.

Acoustical Site Planning Concepts

(This section, with some editing, is from *The Audible Landscape*, FHWA.[1])

The arrangement of buildings on a site can be used to minimize noise impacts. If incompatible land uses already exist, or if a noise sensitive activity is planned, acoustical site planning often provides a successful technique for noise impact reduction.

Many site planning techniques can be employed to shield a residential development from noise. These can include:

1. increasing the distance between the noise source and the receiver;
2. placing noise compatible land uses such as parking lots, maintenance facilities, and utility areas between the source and the receivers. Playgrounds and parks are not necessarily noise compatible activities.
3. locating barrier-type buildings parallel to the noise source or the highway; and
4. orienting the residences away from the noise.

The implementation of many of the above site planning techniques can be combined through the use of cluster and planned unit development techniques.

Distance

Noise can be effectively reduced by increasing the distance between a residential building and a highway. Distance itself reduces sound: doubling the distance from a noise source can reduce its intensity by as much as 3 dBA. In the case of highrise buildings, distance may be the only means, besides acoustical design and construction, of reducing noise impacts. This is because it is nearly impossible to provide physical shielding for the higher stories from adjacent noise.

Noise Compatible Land Uses as Buffers

Noise protection can be achieved by locating noise-compatible land uses between the highway and residential units. Whenever possible, compatible uses should be nearest the noise source. Figure 10 shows a proposed parking garage along two sides of a development in Boston. Both the

MV00170472

Fitzgerald Expressway and the entrance to the Callahan Tunnel which are shown on the site plan are major and noisy traffic routes. In addition to protecting the residential development from the noise and dirt of highway traffic, the parking garage provides needed facilities for the residents.

Buildings as Noise Shields

Additional noise protection can be achieved by arranging the site plan to use buildings as noise barriers. A long building, or a row of buildings parallel to a highway can shield other more distance structures or open areas from noise.

If the building being used as a barrier is sensitive to highway noise, the building itself must first be soundproofed. This technique was used in a housing project in England where a 3,900 foot long, 18 foot wide and 45-70 foot high wall (depending on the terrain) serves as both residence and a sound shield. The wall/building will contain 387 apartments in which the kitchens and bathrooms are placed towards the noise, and the bedrooms and living rooms face away from the highway. The wall facing the highway will be soundproofed and windows, when they exist, are sealed. Substantial noise reductions are expected.

Orientation

The orientation of buildings or activities on a site affects the impact of noise, and the building or activity area may be oriented in such a way as to reduce this impact.

Noise impacts can be severe for rooms facing the roadway since they are closest to the noise source. The noise impact may also be great for rooms perpendicular to the roadway because (a) the noise pattern can be more annoying in perpendicular rooms and (b) windows on perpendicular walls do not reduce noise as effectively as those on parallel walls because of the angle of the sound. Road noise can be more annoying in perpendicular rooms because it is more extreme when it suddenly comes in and out of earshot as the traffic passes around the side of the building, rather than rising and falling in a continuous sound, as it would if the room were parallel to passing vehicles.

Whether the noise impact is greater on the perpendicular or the parallel wall will depend on the specific individual conditions. Once the most severely impacted wall or walls are determined, noise impacts may be minimized by reducing or eliminating windows from these walls.

Buildings can also be oriented on a site in such a way as to exploit the site's natural features. With reference to noise, natural topography can be exploited and buildings placed in low noise pockets if they exist. If no natural noise pockets exist, it is possible to create them by excavating pockets for buildings and piling up earth mounds between them and the noise. Such a structure would obstruct the sound paths and reduce the noise impacts on the residences.

Cluster and Planned Unit Development

A cluster subdivision is one in which the densities prescribed by the zoning ordinance are adhered to but instead of applying to each individual parcel, they are aggregated over the entire site, and the land is developed as a single entity. A planned unit development, or P.U.D., is similar but changes in land use are included, such as apartments and commercial facilities in what would otherwise be a single-family district.

From Figure 11 it can be seen how the conventional grid subdivision affords no noise protection from the adjacent highway. The first row of houses bears the full impact of the noise. In contrast, the cluster and P.U.D. techniques enable open space and commercial uses respectively to serve as noise buffers. Examples of this are shown in Figures 12 and 13. A word of caution is necessary: in a cluster development, the required open space can be located near the highway to minimize noise to the residences. However, many recreation uses are noise sensitive, and when one takes advantage of the flexibility of cluster development to minimize noise, care must be taken not to use all of the available open space in

Figure 11
Conventional Grid Subdivision

Figure 12
Placement of Noise Compatible Uses Near a Highway in a PUD

MV00170473

buffer strips, thus depriving the development of a significant open space area. Where high noise levels exist, a combination of buffer strips and other techniques (such as berms and acoustical sound proofing) can be employed.

The flexibility of the cluster and planned unit development techniques allows many of the above site planning techniques to be realized and effective noise reduction achieved.

Reviewing Site Plans

There are two main things to check when reviewing site plan changes to determine if the revised site plan provides adequate attenuation for the noise sensitive uses:

1. Is the separation between the source and the receiver great enough?
2. If noise-compatible buildings are being used as barriers for other buildings, are they adequate barriers, i.e., are they long enough and are they high enough? (And, if the buildings being used as barriers contain noise sensitive activities, have the buildings been properly soundproofed.)

In order to determine whether the proposed site plan changes will provide adequate separation between the source and the receiver, you simply go back to the *Noise Assessment Guidlines* procedures. You can use the *Guidelines* both to determine if the proposed separation distance is sufficient or to determine the necessary separation distance. You should at this point check to make sure that the uses being located in the "buffer zone" between the source and the receiver are indeed noise compatible uses. If parks or playgrounds are located in the buffer zone, make sure they are not the only ones associated with the project.

To determine whether the noise compatible buildings being proposed as barriers are adequate, you simply use the procedures outlined in the preceding section. Determine whether the building is high enough to properly break the line of sight between the receiver and the source. Then determine if the building is long enough. It is not necessary to check to make sure it is made of the proper materials or that it is properly constructed since the building will be inherently thick enough not to have any problems. Again, however, if the building being proposed as a barrier contains noise sensitive uses you must first verify that it is properly soundproofed. (See the next section for guidance on acoustical construction.) If the building is not properly soundproofed then it can not be used as a barrier for other buildings.

As you review the site plan check to see that the building locations will not aggravate noise problems. Figure 14 shows how building arrangement can make the noise problem worse.

Acoustical Construction Concepts

(This section, with some editing is taken from the *Audible Landscape, FHWA.*[1])

Noise can be intercepted as it passes through the walls, floors, windows, ceilings, and doors of a building. Examples of noise reducing materials and construction techniques are described in the pages that follow.

To compare the insulation performance of alternative constructions, the Sound Transmission Class (STC) is used as a measure of a material's ability to reduce sound. Sound Transmission Class is equal to the number of decibels a sound is reduced as it passes through a material. Thus, a high STC rating indicates a good insulating material. It takes into account the influence of different frequencies on sound transmission, but essentially the STC is the difference between the sound levels on the side of the partition where the noise originates and the side where it is received. For example, if the external noise level is 85 dB and the desired internal level is 45 dB, a partition of 40 STC is required. The Sound Transmission Class rating is the official rating endorsed by the American Society of Testing and Measurement. It can be used as a guide in determining what type of construction is needed to reduce noise.

The use of the STC rating system for transportation noise is a subject of some debate. The STC rating was originally intended primarily for use with interior partitions and relates to the "subjective impressions of the sound insulation provided against the sounds of speech, radio, television, music, and similar sources of noise in offices and dwellings."[2] However, since it remains the only widely used noise reduction rating system for materials the STC system is very often used even with transportation noise. When STC ratings are used for transportation noise you should be aware that the STC ratings may be a few dB too high. For example, the STC rating for a standard frame 2 × 4 wall with exterior siding, and sheathing and interior sheetrock may be 37 dB.[3] If rated specifically for transportation noise the dB reduction rating might drop to 34 dB.[4] All this really means, however, is that you should use the STC ratings with a bit of caution and remain aware of the possible 2-3 dB overstating that you may get with the STC rating system. Throughout this text we will be talking in terms of STC ratings for materials and assemblies.

Walls

Walls provide building occupants with the most protection from exterior noise. Different wall materials and designs vary greatly in their sound insulating properties. Figure 15 provides a visual summary of some ways in which the acoustical properties can be improved:

Increase the mass and stiffness of the wall. In general, the denser the wall material, the more it will reduce noise. Thus, concrete walls are better insulators than wood walls of equal thickness. Increasing the thickness of a wall is another way to increase mass and improve sound insulation. Doubling the thickness of a partition can result in as much as a 6 dB reduction in sound.[1] However, the costs of construction tend to limit the feasibility of large increases in wall mass.

The relative stiffness of the wall material can influence its sound attenuation value. Care must be taken to avoid wall constructions that can vibrate at audible frequencies and transmit exterior sounds.

Figure 15
The Audible Landscape

Factors which influence sound attenuation of walls

MV00170476

Use cavity partitions. A cavity wall is composed of two or more layers separated by an airspace. The airspace makes the cavity wall a more effective sound insulator than a single wall of equal weight, leading to cost savings.

Increase the width of the airspace. A three inch airspace provides significant noise reduction, but increasing the spacing to six inches can reduce noise levels by an additional 5 dBA. Extremely wide airspaces are difficult to design.

Increase the spacing between studs. In a single stud wall, 24 inch stud spacing gives a 2-5 dB increase in STC over the common 16 inch spacing.[2]

Use staggered studs. Sound transmission can be reduced by attaching each stud to only one panel and alternating between the two panels.

[2]Leslie T. Doelle, Environmental Acoustics (New York, McGraw-Hill Book Company, 1972), pp. 232-233.

Use resilient materials to hold the studs and panels together. Nails severely reduce the wall's ability to reduce noise. Resilient layers such as fiber board and glass fiber board, resilient clips, and semi-resilient attachments are relatively inexpensive, simple to insert, and can raise the STC rating by 2-5 dB.[1]

Use dissimilar layers. If the layers are made of different materials and/or thickness, the sound reduction qualities of the wall are improved.[2]

Add acoustical blankets. Also known as isolation blankets, these can increase sound attenuation when placed in the airspace. Made from sound absorbing materials such as mineral or rock wool, fiberglass, hair felt or wood fibers, these can attenuate noise as much as 10 dB.[3] They are mainly effective in relatively lightweight construction.

Seal cracks and edges. If the sound insulation of a high performance wall is ever to be realized, the wall must be well sealed at the perimeter. Small holes and cracks can be devastating to the insulation value of a wall. A one-inch square hole or a 1/16 inch crack 16 inches long will reduce a 50 STC wall to 40.[4]

Figure 16 shows a sample of wall types ranging from the lowest to the highest sound insulation values.

Remember that the effectiveness of best wall construction will be substantially reduced if you permit vents, mail slots or similar openings in the walls. If vents are permitted the ducts must be specially designed and insulated to make sure noise does not reach the inside. The best approach is simply to eliminate all such openings on impacted walls.

Figure 16
Walls

MV00170477

Windows

Sound enters a building through its acoustically weakest points, and windows are one of the weakest parts of a wall. An open or weak window will severely negate the effect of a very strong wall. Whenever windows are going to be a part of the building design, they should be given acoustical consideration. Figure 17 illustrates the effects of windows on the sound transmission of walls. For example, if a wall with an STC rating of 45 contains a window with an STC rating of 26 covering 30% of its area, the overall STC of the composite partition will be 35, a reduction of 10 dB.

The following is a discussion of techniques that can be used to reduce noise in a building by means of its windows. These techniques range from a blocking of the principal paths of noise entry to a blocking of the most indirect paths.

Close windows. The first step in reducing unwanted sound is to close and seal the windows. The greatest amount of sound insulation can be achieved if windows are permanently sealed. However, openable acoustical windows have been developed which are fairly effective in reducing sound.[1] Whether or not the sealing is permanent, keeping windows closed necessitates the installation of mechanical ventilation systems. If you are dealing with single family houses and some of the windows are facing away from all noise sources, a whole house fan may be better and cheaper than air conditioning. In multifamily housing or where all windows are exposed to the noise sources you will have to go with the air conditioning. If windows must be openable, special seals are available which allow windows to be opened.[2]

Reduce window size. The smaller the windows, the greater the transmission loss of the total partition of which the window is a part. Reducing the window size is a technique that is used because (a) it precludes the cost of expensive acoustical windows, and (b) it saves money by cutting down the use of glass. The problems with this technique are (a) it is not very effective in reducing noise; e.g., reducing the proportion of window to wall size from 50% to 20% reduces noise by only 3 decibels; and (b) many building codes require a minimum window to wall size ratio.

Figure 17
STC

Increase glass thickness. If ordinary windows are insufficient in reducing noise impacts in spite of sealing techniques, then thicker glass can be installed. In addition, this glass can be laminated with a tough transparent plastic which is both noise and shatter resistant. Glass reduces noise by the mass principle; that is, the thicker the glass, the more noise resistant it will be. A 1/2-inch thick glass has a maximum STC rating of 35 dB compared to a 25 dB rating for ordinary 3/16 inch glass.

Instructions on use of graph

1. Subtract the STC value of the door, window or opening from the STC value of the wall.
2. Enter the vertical axis of the graph at the point that matches the value from step 1.
3. Read across to the curve that represents the percentage of the total area of the wall that is taken up by the door, window, or opening.
4. Read down to the horizontal axis.
5. Subtract the value on the horizontal axis from the original STC value of the wall. The result is the composite STC value of the wall and the door, window or opening.

[2] Los Angeles Department of Airports, *Guide to the Soundproofing of Existing Homes Against Exterior Noise*. Report No. WRC 70-2, March 1970, pp. 9-11, 22-30. In this report, the function and performance of a number of operable seals are described.

MV00170478

However, glass thicknesses are only practical up to a certain point, when STC increases become too insignificant to justify the cost. For example, a 1/2 inch thick glass can have an STC of 35; increasing the thickness to 3/4 inch only raises the STC to 37. However, a double glass acoustical window consisting of two 3/16 inch thick panes separated by an airspace will have an STC of 51 and can cost less than either solid window.

In addition to thickness, proper sealing is crucial to the success of the window. To prevent sound leaks, single windows can be mounted in resilient material such as rubber, cork, or felt.

Install Double-Glazed Windows. Double-glazed windows are paired panes separated by an airspace or hung in a special frame. Generally, the performance of the double-glazed window may be increased with:

- increased airspace width
- increased glass thickness
- proper use of sealings
- slightly dissimilar thicknesses of the panes
- slightly non-parallel panes

In general the airspace between the panes should not be less than 2–4 inches if an STC above 40 is desired. If this is not possible, a heavy single-glazed window can be used. The use of slightly non-parallel panes is a technique employed when extremely high sound insulation is required, such as in control rooms of television studios.

The thickness of double-glazed panes may vary from 1/8 to 1/4 inch or more per pane. Although thickness is important, the factors which most determine the noise resistance of the window is the use of sealant and the width of the airspace.

As in the case of all windows, proper sealing is extremely important. To achieve an STC above 43, double-glazed windows should be sealed permanently. If the windows must be openable, there are available special frames and sealers for openable windows which allow a maximum STC of 43.[1]

Permanently sealed double-glazed windows often require an air pressure control system to maintain a constant air pressure and minimal moisture in the airspace. Without this system, the panes may deflect, and, in extremely severe cases, pop out of the frames.

[1]Ibid.

To further insure isolation of noise between double-glazed panes, the panes could be of different thicknesses, different weights, and slightly non-parallel to each other. This prevents acoustical coupling and resonance of sound waves.

Doors

Acoustically, doors are even weaker than windows, and more difficult to treat. Any door will reduce the insulation value of the surrounding wall. The common, hollow core wood door has an STC rating of 17 dB. Taking up about 20% of the wall, this door will reduce a 48 STC wall to 24 STC. To strengthen a door against noise, the hollow core door can be replaced by a heavier solid core wood door that is well sealed[1] and is relatively inexpensive. A solid core wood door with vinyl seal around the edges and carpeting on the floor will reduce the same 48 STC wall to only 33 dB.[2] An increased sound insulation value can be achieved if gasketed stops or drop bar threshold closers are installed at the bottom edge of the door. (See Figure 18)

The alternative solution to doors is to eliminate them whenever possible from the severely impacted walls and place them in more shielded walls.

In any case no mail slots or similar openings should be allowed in exterior doors.

Roofs

Acoustical treatment of roofs is not usually necessary unless the noise is extremely severe or the noise source is passing over the building. The ordinary plaster ceiling should provide adequate sound insulation except in extremely severe cases. An acoustically weak roof which is likely to require treatment is the beamed ceiling.[3] Beamed ceilings may be modified by the addition of a layer of fiberglass or some other noise resistent material. Suspended ceilings are the most effective noise reducers but they are also the most expensive.

[2]U.S. Gypsum, Sound Control... p. 100.

[3]Ibid p. 15.

Figure 18

Gasketed door stop

Drop bar threshold closer

MV00170479

Floors

In the case of highway noise, floors would only require acoustical treatment if the highway were passing under the building. In this case, flooring would have to provide protection against structural vibrations as well as airborne sound.

Two ways to insulate a floor from noise are to install a solid concrete slab at least 6 inches thick or install a floating floor. In general, the floating floor gives the greatest amount of sound and vibration insulation; however, it is extremely expensive. Basically, a floating floor consists of a wood or concrete slab placed over the structural slab, but separated by a resilient material. The resilient material isolates the surface slab from the structural slab and the surrounding walls.

What to Look for When Reviewing Plans

The number of possible combinations of the building materials that go into walls, ceilings, windows and doors, is, no doubt, considerably short of infinite. It is however still a very large number, large enough that it would be impossible to compile a list of all the possible combinations. Therefore, do not expect to find in this section, or anywhere else for that matter, a neat table showing the STC ratings for all the types of construction you may encounter. In fact, it is not really your responsibility to determine the precise STC ratings for the walls, ceilings, windows and doors in the projects you review. Your job is simply to review the attenuation levels claimed by the sponsor/developer and determine whether or not they are reasonable.

To enable you to perform the above described task, we have prepared a list of the most common types of construction for which we have STC ratings. By comparing the type of construction proposed to one of these "model" types you should be able to tell whether the claimed STC rating is reasonable. For example, the sponsor/developer submits a description of his building stating that a 2 × 6 stud wall with standard sheathing, insulation, wood siding, and 1/2" gypsum board achieves a STC rating of 48. You look at Table 3 and find that the closest "model" wall is a 2 × 4 stud wall with wood siding, sheathing, insulation, and 1/2" gypsum board. This wall has a STC rating of 39. An 9 dB difference is quite significant considering that the walls are really quite similar. You would probably want to go back to the developer/sponsor and ask for some supporting data that proves that the 2 × 6 wall he proposes will indeed provide 48 dB of noise attenuation.

In order to make it easier to review the attenuation levels provided by the proposed construction, we suggest that you ask the developer/sponsor to complete a form such as shown in Figure 19. Such a form will give you all the information you need in a properly organized format that will facilitate your review. You could fill in the first part and simply have the developer/sponsor fill out the second part and return it with the developer certification or other project documents.

As you will recall from the previous section, most walls provide pretty good attenuation by themselves. It is the presence of windows and doors and openings such as vents that reduces the attenuation capability of the wall. Thus, after you have determined whether the basic wall itself has a reasonable STC, you must review the impact of the windows and doors. You do this by using Figure 17. First you determine the difference between the STC ratings for the wall and the windows. You enter the vertical axis of Figure 17 with that number. You read across until you intersect the line that represents the percentage of the wall taken up by the windows. Then you read down to the horizontal axis where you wil find the value to be subtracted from the basic STC value of the wall. The resulting number is the combined STC value for the wall. If the wall also contains a door, repeat the same procedure, only start out with the modified STC rating for the wall. If the wall has doors only, then obviously you start with the basic wall STC rating. Finally you compare the number you have derived with that listed by the developer/sponsor. If they are fairly close, you need not pursue it further. If there is a substantial difference, you should ask for an explanation or documentation from the developer.

Once again, we caution you about borderline cases. If the attenuation required is 30 dB and the STC rating for the proposed construction is exactly 30 dB, you may want to ask the developer to provide even more attenuation. Remember that we discussed how the STC rating may overstate the actual attenuation provided by as much as 3 dB. If an additional 3 dB can be achieved at minimum cost, we would strongly urge that you seek it from the developer/sponsor.

Finally check to make sure the developer has provided some form of mechanical ventilation. If it's a single family house and a whole house fan is the means of ventilation being provided make sure that there are operable windows on walls which do not face the noise source(s) nor are perpendicular to the source(s). Otherwise the residents will have to open windows on the exposed wall, thus cancelling out much of the attenuation achieved.

hat are the four things to check eviewing a proposed barrier?
st 3 ways to make a barrier more e without increasing its overall

11. List 3 ways to make a barrier more effective without increasing its overall length.
12. What is the maximum percentage of the total area of a barrier that can be made up of openings without a significant loss in barrier effectiveness?
13. List 3 site planning techniques that are used to shield residential developments.
14. When are parks and playgrounds not noise compatible uses that can be employed as buffers?
15. What are the two main things to look for when reviewing site plan changes?
16. What are some of the building orientations which can aggravate noise problems?
17. What is the Sound Transmission Class (STC) rating?
18. Which is better a high STC or a low STC rating?
19. What kinds of conditions were STC ratings originally developed for?
20. What should you do when using STC ratings in a transportation noise situation?
21. List 5 ways to improve the attenuation capability of a wall.
22. Windows are one of the acoustically weakest components in a wall. List 3 ways to reduce the negative effects of windows.
23. What is the best way to reduce the effect of doors?

MV00170486

Quiz on Noise Attenuation

Answers

1. a. barriers or berms
   b. site design
   c. acoustical construction
2. a. to make sure the project sponsor/developer is aware of the attenuation requirements
   b. provide sponsor/developer with an overview of available options
   c. review attenuation proposals to make sure they are adequate
3. a. A **diffracted** path over the top of the barrier
   b. A **transmitted** path through the barrier
   c. A **reflected** path away from the receiver
4. "Path Length Difference" is the difference in distance that sound must travel diffracting over the barrier rather than passing directly through it. Since sound energy decreases over distance, the greater the path length distance the greater the attenuation.
5. "Transmission Loss Values" represent the amount noise levels will be reduced when the sound waves pass through a barrier.
6. Since the attenuation provided by a barrier is a function of both the sound energy that goes over the top and the energy that goes through the barrier, if the transmission loss value is low then the effectiveness of the barrier will be greatly reduced.
7. If the transmission loss value of the barrier material is at least 10dB greater than the attenuation level provided by diffraction (i.e. barrier height) there shouldn't be any problem.
8. No. The combined effect of multiple barriers does not normally provide significantly greater attenuation than a single barrier. For design purposes, the general procedure is to assume the attenuation of the most effective barrier.
9. a. Is it high enough?
   b. Is it long enough?
   c. Is it made of the right material?
   d. Is it properly constructed?
10. a. move the barrier closer to the source
    b. bend the top of the barrier towards the source
    c. do both
11. a. move it closer to the receiver
    b. bend the ends toward the receiver
    c. do both
12. 1 percent
13. Any 3 of the below:
    a. increasing the distance between the source and the receiver
    b. placing noise compatible land uses between the source and the receiver
    c. locating barrier type buildings parallel to the source
    d. orienting residences away from the noise
14. when they are the only ones associated with the project
15. a. is the separation between the source and receiver great enough
    b. If a noise compatible building is being used as a barrier is it tall and long enough?
16. Building orientations which trap noise and cause it to reverberate off building walls. This would include shapes where a court is open to the source or where a series of buildings are arranged perpendicular to the source.
17. The STC rating is equal to the number of decibels a sound is reduced as it passes through a material.
18. A high STC rating is better.
19. The STC ratings were originally intended primarily for use with interior partitions and for noise such as speech, radios, television.
20. Recognize that the STC rating may overstate the effectiveness of the materials by 2-3db.
21. Any of the 9 below:
    a. increase the mass and stiffness of the wall
    b. use cavity partitions
    c. increase the width of the airspace
    d. increase the spacing between studs
    e. use staggered studs
    f. use resilient materials to hold the studs and finish materials together
    g. use of dissimilar layers (leaves)
    h. add acoustical blankets
    i. seal cracks and edges
22. Any of the 4 below:
    a. close the windows and provide mechanical ventilation
    b. reduce window size
    c. increase glass thickness
    d. install double glazed windows
23. Eliminate them from severely impacted walls

Noise Assessment Guidelines

U.S. Department of Housing and Urban Development
Office of Policy Development and Research

Noise Assessment Guidelines

MV00170488

Noise Assessment Guidelines

MV00170489

Foreword

In choosing among alternative sites for housing, potential noise problems are prominent among the issues that must be examined. These Noise Assessment Guidelines were developed to provide HUD field staff, interested builders, developers, and local officials with an easy-to-use method of evaluating noise problems with a minimum of time and effort.

We believe that this set of tools will simplify the process of balancing the goal of environmental protection with those of efficiency and reduced housing costs. We hope you will find them useful, and invite your comments.

Acting Assistant Secretary for
Policy Development and Research

Stephen J. Bollinger
Assistant Secretary for
Community Planning and
Development

MV00170490

Preface

The Department of Housing and Urban Development, in its efforts to provide decent housing and a suitable living environment, is concerned with noise as a major source of environmental pollution and has issued Subpart B on Noise Abatement and Control to Part 51 of Title 24 of the Code of Federal Regulations.

The policy established by Subpart B embodies HUD objectives to make the assessment of the suitability of the noise environment at a site: (1) easy to perform; (2) uniformly applicable to different noise sources; and (3) as consistent as possible with the assessment policies of other Federal departments and agencies. In furtherance of these objectives, the Office of Policy Development and Research has sponsored research to provide site analysis techniques. These *Noise Assessment Guidelines* do not constitute established policy of the Department but do provide a methodology whose use is encouraged by HUD as being consistent with its objectives. The *Guidelines* provide a means for assessing separately the noise produced by airport, highway, and railroad operations, as well as the means for aggregating their combined effect on the overall noise environment at a site.

This booklet has been prepared by Bolt Beranek and Newman Inc., under Contract No. H-2243R for the U.S. Department of Housing and Urban Development. It is a revision of an earlier edition published in August 1971. With the exception of changes made by the Department, the contractor is solely responsible for the accuracy and completeness of the data and information contained herein.

MV00170492

Introduction

These guidelines are presented as part of a continuing effort by the Department of Housing and Urban Development to provide decent housing and a suitable living environment for all Americans.

The procedures described here have been developed so that people without technical training will be able to assess the exposure of a housing site to present and future noise conditions. In this context, the site may hold only one small building, in which case the noise assessment is straightforward. Larger sites may hold larger buildings, or many buildings, and the noise level may be different at different parts of the site (or building). Assessments of the noise exposure should be made at representative locations around the site where significant noise is expected. These are designated as "Noise Assessment Locations," abbreviated NAL in the following text.

The only materials required are a map of the area, a ruler (straight edge), a protractor and a pencil. Worksheets and working figures are provided separately.

All of the information you need can be easily obtained – usually by telephone. For convenience, this information is listed at the beginning of each section under headings that indicate the most likely source. While you are obtaining this information, be sure to ask about any approved plans for future changes that may affect noise levels at the site – for example: land-use changes, changes in airport runway traffic, widening of roads, and so forth. In all evaluations, you should assess the condition that will have the most severe or most lasting effect on the use of the site.

Wherever possible, you should try to assess noise environments expected at least ten years in the future.

The degree of acceptability of the noise environment at a site is determined by the outdoor day-night average sound level (DNL) in decibels (dB). The assessment of site acceptability is presented first as an evaluation of the site's exposure to three major sources of noise – aircraft, roadways, and railways. These are then combined to assess the total noise at a site. Worksheets are provided at the back of these Guidelines to use in summarizing your evaluations.

The noise environment at a site will come under one of three categories:

Acceptable (DNL not exceeding 65 decibels) The noise exposure may be of some concern but common building constructions will make the indoor environment acceptable and the outdoor environment will be reasonably pleasant for recreation and play.

Normally Unacceptable (DNL above 65 but not exceeding 75 decibels) The noise exposure is significantly more severe; barriers may be necessary between the site and prominent noise sources to make the outdoor environment acceptable; special building constructions may be necessary to ensure that people indoors are sufficiently protected from outdoor noise.

Unacceptable (DNL above 75 decibels) The noise exposure at the site is so severe that the construction cost to make the indoor noise environment acceptable may be prohibitive and the outdoor environment would still be unacceptable.

When measuring the distance from the site to any noise source, measure from the source to the nearest points on the site where buildings having noise-sensitive uses are located. These points define the Noise Assessment Locations for the site. The relevant measurement location for buildings is a point 2 meters (6.5 feet) from the facade.

If at any point during the assessment the site's exposure to noise is found to be Unacceptable or Normally Unacceptable, every effort should be made to improve the condition, e.g., the location of the proposed dwellings can be changed or some shielding can be provided to block the noise from that source.

Where quiet outdoor space is desired at a site, distances should be measured from the important noise sources to the outdoor area in question and the combined noise exposure should be assessed.

Frequently, the locations of dwellings have not yet been specified at the time the noise assessment of a site is made. In these instances, distances used in the noise assessment should be measured as 2 meters less than the distance from the building setback line to the major sources of noise.

MV00170493

Combining Sound Levels in Decibels

The noise environment at a site is determined by combining the contributions of different noise sources. In these Guidelines, Workcharts are provided to estimate the contribution of aircraft, automobile, truck, and train noise to the total day-night average sound level (DNL) at a site. The DNL contributions from each source are expressed in decibels and entered on Worksheet A. The combined DNL from all the sources is the DNL for the site and is the value used to determine the acceptability of the noise environment.

Sound levels in decibels *are not combined by simple addition!* The following table shows how to combine sound levels:

Table

Difference in Sound Level	Add to Larger Level
0	3.0
1	2.5
2	2.1
3	1.8
4	1.5
5	1.2
6	1.0
7	0.8
8	0.6
9	0.5
10	0.4
12	0.3
14	0.2
16	0.1
Greater than 16	0

Use the table by first finding the numerical difference in sound level between two levels being combined. Entering the table with this value, find the value to be added to the larger of the two levels, add this value to the larger level to determine the total. Where more than two levels are to be combined, use the same procedure to combine any two levels; then use this subtotal and combine it with any other level, and so on. Fractional numerical values may be interpolated from the table; however, the final result should be rounded to the nearest whole number.

ple 1: In performing a site evaluation, arate DNL values for airports, road and railroads have been listed on eet A as 56, 63, and 61 decibels. In complete the final evaluation of the se separate DNL values must be d. The difference between 63 and om the table you find that 0.8 should d to 63, for a subtotal of 63.8. The e between 63.8 and 61 is 2.8; from you interpolate that approximately d be added to 63.8 for a total of 65.7 when rounded to whole numbers. mple shows how noise from different may be Acceptable, individually, at a hen combined, the total noise en- may exceed the Acceptable DNL decibels.

MV00170494

Aircraft

Necessary Information

To evaluate a site's exposure to aircraft noise, you will need to consider all airports (civil and military) within 15 miles of the site. The information required for this evaluation is listed below under headings that indicate the most likely source. Before beginning the evaluation, you should record the following information on Worksheet B:

From the FAA Area Office or the Military Agency in charge of the airport:

- Are current DNL or NEF (Noise Exposure Forecast) contours available? Noise contours are available for almost all military airports. These contours have been developed and published as part of the Air Installation Compatible Use Zone (AICUZ) program of the Department of Defense. The contours are published normally as part of an AICUZ report. Noise contours are also available for many civil airports. When available, they are superimposed on a map with an appropriately marked scale (see Figure 1, page 4).
