# 1 Project Description and Impact Summary

## 1.1 Introduction

This study analyzes the potential noise and vibration impacts of the proposed Redlands Boulevard and Hemlock Avenue Gas Station Project (project) in the City of Moreno Valley, Riverside County, California. Rincon Consultants, Inc. (Rincon) prepared this study for A&S Engineering, Inc. (applicant) for use in support of environmental documentation pursuant to the California Environmental Quality Act (CEQA). The purpose of this study is to analyze the project's noise and vibration impacts related to both temporary construction activity and long-term operation of the project. Table 1 provides a summary of project impacts.

**Table 1 Summary of Impacts**

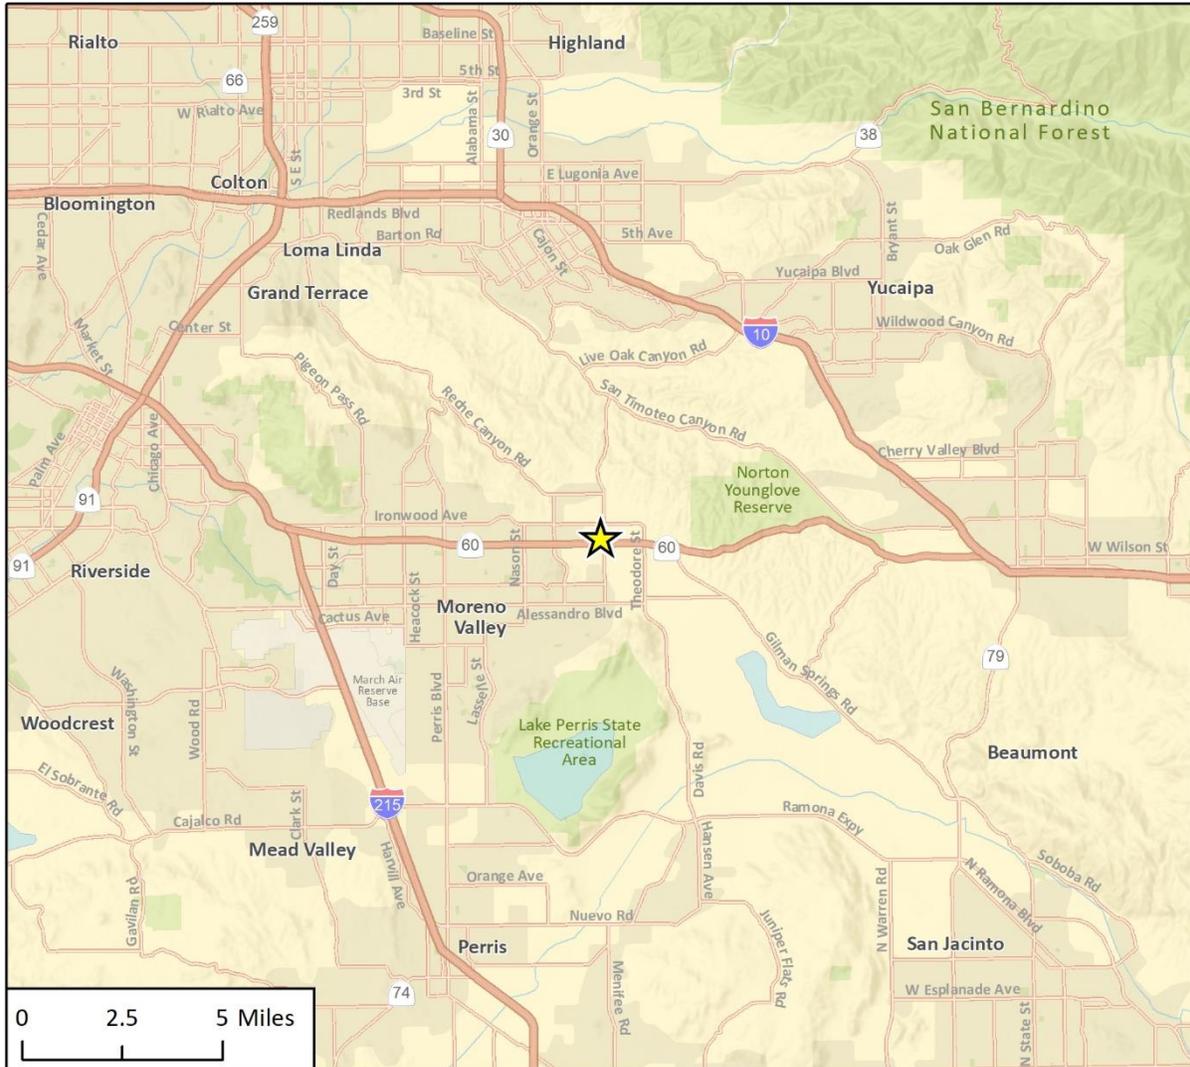

| Impact Statement   | Level of Significance        | Applicable Recommendations |
|--|------------------------------|----------------------------|
| Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?                             | Less Than Significant Impact | None                       |
| Would the project result in generation of excessive groundborne vibration or groundborne noise levels?   | Less Than Significant Impact | None                       |
| For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? | No Impact                    | None                       |

## 1.2 Project Summary

### Project Location

The proposed project is located on a 2.4-acre portion of a 6.9-acre parcel located in the City of Moreno Valley in Riverside County, California. The project site lies south of the intersection of Redlands Boulevard and Hemlock Avenue (Assessor Parcel Number 488-310-012). The project site is currently vacant. Surrounding land uses include residences and commercial uses to the south and vacant land to the west and north. Redlands Boulevard borders the project to the east. In addition, the Redlands and Hemlock Booster Station is adjacent to the project's eastern boundary. State Route (SR) 60 is approximately 560 feet south of the project site. Figure 1 shows the project site's regional location and Figure 2 shows an aerial view of the project site and surrounding area.

★ Project Location

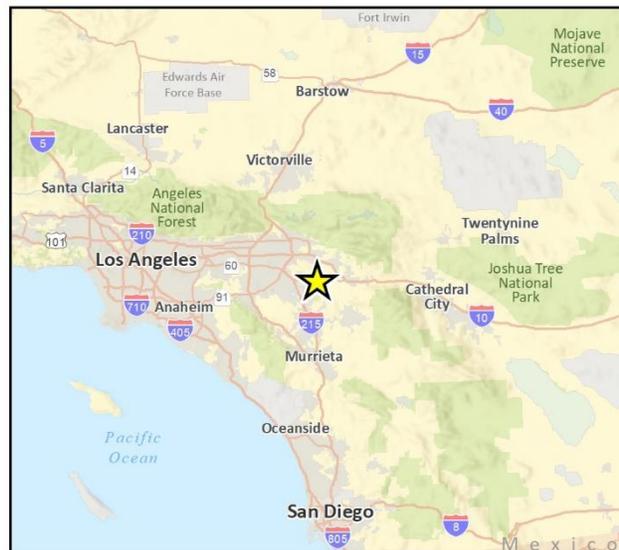

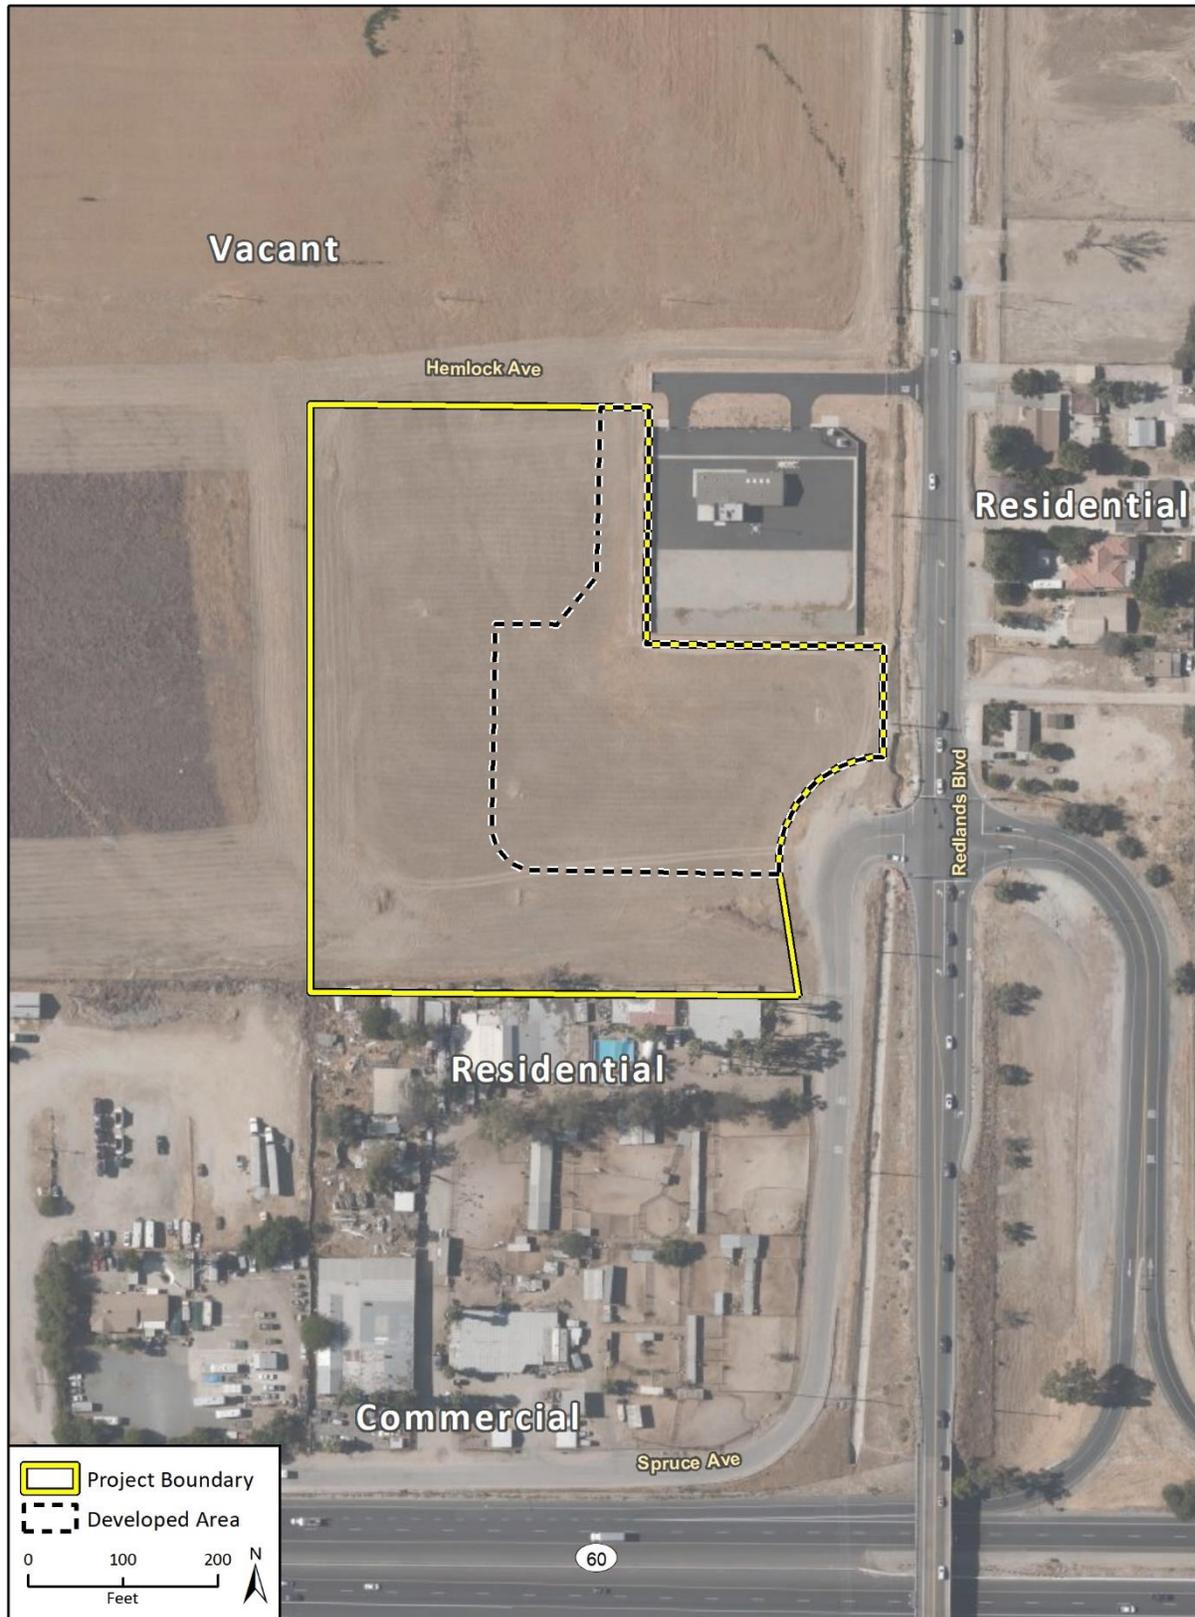

Fig 1 Regional Location

Figure 2 Project Site Location

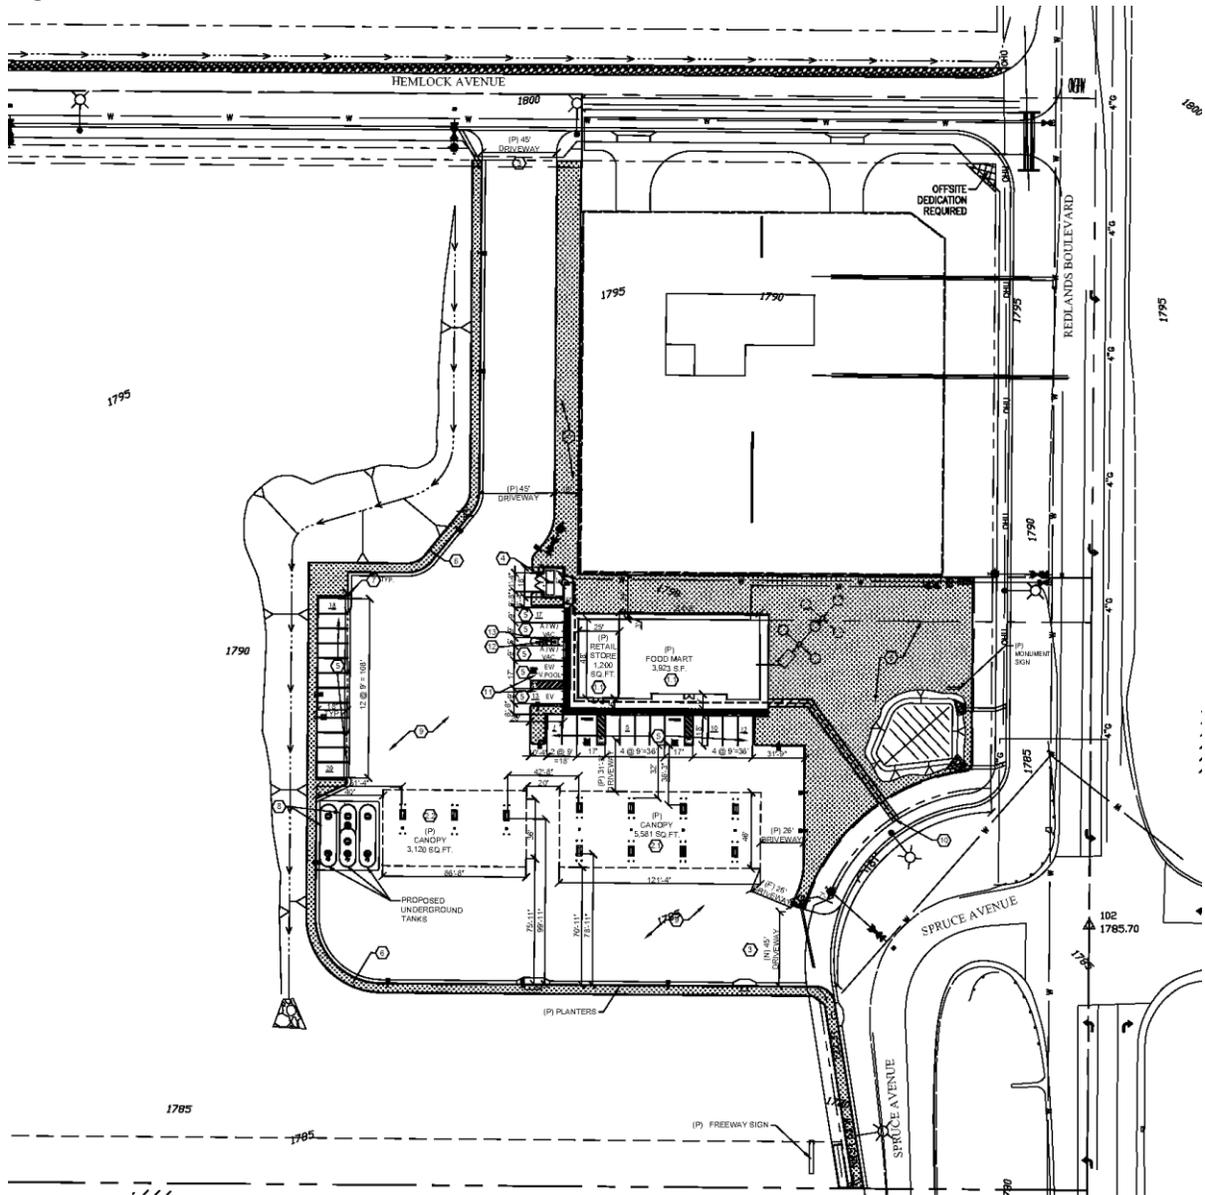

## **Project Description**

The project would include the development of a gas station with 11 fueling stations (16 total dispensers), a 3,923 square foot food mart with 1,200 square feet of office and storage in the mezzanine level, and a 1,200 square foot retail store adjacent to the food mart. Of the 16 dispensers, 14 of the dispensers would be gasoline dispensers and would be underneath a 5,581 square foot canopy. The remaining 2 dispensers would be diesel dispensers underneath a 3,120 square foot canopy. An 18 x 12.5 x 6 foot trash enclosure would also be constructed adjacent to the western boundary of the food mart/retail store. The project would also be served by an on-site septic system. The project would provide a total of 29 parking spaces in a surface lot with two stalls for electric vehicle parking. Additional improvements include curb and sidewalk enhancements and landscaping. Access to the project site would be provided from two driveways with one off Redlands Boulevard and the other driveway off of Hemlock Avenue. Of the 6.9-acre site, only approximately 2.4 acres would be developed; the remaining 4.5 acres would remain undeveloped. An additional 0.63 acres would be improved for off-site modifications (e.g., storm drain improvements) for a total disturbed area of 7.53 acres. Figure 3 shows the project plan layout.

## **Construction**

Construction is expected to begin in January 2022 and estimated to be completed in December 2022 for a total construction period of 12 months. Construction activities would include site preparation, grading, building construction, paving, and architectural coating (e.g., painting). During grading, approximately 300 cubic yards of soil would be exported. All construction would occur within the current conceptual limits of the project.

Figure 3 Site Plan

## 2 Background

---

### 2.1 Overview of Sound Measurement

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment (California Department of Transportation [Caltrans] 2013).

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response, which is most sensitive to frequencies around 4,000 Hertz and less sensitive to frequencies around and below 100 Hertz (Kinsler, et. al. 1999). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used to measure earthquake magnitudes. A doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dBA; reducing the energy in half would result in a 3 dBA decrease (Crocker 2007).

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources do not “sound twice as loud” as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease (i.e., twice the sound energy); that a change of 5 dBA is readily perceptible (8 times the sound energy); and that an increase (or decrease) of 10 dBA sounds twice (half) as loud ([10.5x the sound energy] Crocker 2007).

Sound changes in both level and frequency spectrum as it travels from the source to the receiver. The most obvious change is the decrease in level as the distance from the source increases. The manner in which noise reduces with distance depends on factors such as the type of sources (e.g., point or line, the path the sound will travel, site conditions, and obstructions). Noise levels from a point source typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance (e.g., construction, industrial machinery, ventilation units). Noise from a line source (e.g., roadway, pipeline, railroad) typically attenuates at about 3 dBA per doubling of distance (Caltrans 2013). The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, receives no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result from simply the geometric spreading of the source. An additional ground attenuation value of 1.5 dBA per doubling of distance applies to a soft site (e.g., soft dirt, grass, or scattered bushes and trees) (Caltrans 2013). Noise levels may also be reduced by intervening structures. The amount of attenuation provided by this “shielding” depends on the size of the object and the frequencies of the noise levels. Natural terrain features such as hills and dense woods, and man-made features such as buildings and walls, can substantially alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receiver (Federal Highway Administration [FHWA] 2011). Structures can substantially reduce exposure to noise as well. The FHWA’s guidelines indicate that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important factors of project noise impact. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently used noise metrics is the equivalent noise level ( $L_{eq}$ ); it considers both duration and sound power level.  $L_{eq}$  is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over time. Typically,  $L_{eq}$  is summed over a one-hour period.  $L_{max}$  is the highest root mean squared (RMS) sound pressure level within the sampling period, and  $L_{min}$  is the lowest RMS sound pressure level within the measuring period (Crocker 2007).

Noise that occurs at night tends to be more disturbing than that occurring during the day. Community noise is usually measured using Day-Night Average Level ( $L_{dn}$ ), which is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours; it is also measured using Community Noise Equivalent Level (CNEL), which is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013). Noise levels described by  $L_{dn}$  and CNEL usually differ by about 1 dBA or less. The relationship between the peak-hour  $L_{eq}$  value and the  $L_{dn}$ /CNEL depends on the distribution of traffic during the day, evening, and night. Quiet suburban areas typically have CNEL noise levels in the range of 40 to 50 dBA, while areas near arterial streets are in the 50 to 60-plus CNEL range. Normal conversational levels are in the 60 to 65-dBA  $L_{eq}$  range; ambient noise levels greater than 65 dBA  $L_{eq}$  can interrupt conversations (Federal Transit Administration [FTA] 2018).

## 2.2 Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of Hz. The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body starts from a low frequency of less than 1 Hz and goes to a high of about 200 Hz (Crocker 2007).

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (FTA 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors. The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect the propagation of vibration over long distances (Caltrans 2020). When a building is affected by

vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings (Caltrans 2020).

## 2.3 Sensitive Receivers

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. Sensitive land uses are generally defined as locations where people reside or where the presence of noise could adversely affect the use of the land. The City of Moreno Valley General Plan list of noise sensitive uses includes residences, motels and hotels, nursing homes, auditoriums, natural areas, parks, and outdoor recreation (City of Moreno Valley 2021). Sensitive receivers in the area include the single-family residences located across Redlands Boulevard to the east of the project site and office zoned single-family residences adjacent to the south of the project site.

Vibration sensitive receivers are similar to noise sensitive receivers, such as residences and institutional uses (e.g., schools, libraries, and religious facilities). The General Plan does not identify vibration sensitive receivers, however concert halls, hospitals, libraries, research operations, residential areas, schools, and offices would also be considered vibration sensitive uses. Vibration sensitive receivers also include buildings where vibrations may interfere with vibration-sensitive equipment, affected by levels that may be well below those associated with human annoyance (FTA 2018; Caltrans 2013).

## 2.4 Project Noise Setting

The most common source of noise in the project site vicinity is vehicular traffic from Redlands Boulevard, Spruce Avenue, and SR 60. To characterize ambient sound levels at and near the project site, two 15-minute sound level measurements were conducted on March 16, 2021. Noise Measurement (NM) 1 was taken at the central eastern edge of the project site to capture noise levels from Redlands Boulevard across the street from existing single-family residences. NM2 was taken at the central southern edge of the project site to capture ambient noise levels at the adjacent residences due to Spruce Avenue and SR 60 traffic noise. Table 2 summarizes the results of the noise measurement, and Table 3 shows the recorded traffic volumes from the noise measurement.

**Table 2 Project Site Vicinity Sound Level Monitoring Results**

| Measurement Location | Measurement Location  | Sample Times       | Approximate Distance to Primary Noise Source               | L <sub>eq</sub> (dBA) | L <sub>min</sub> (dBA) | L <sub>max</sub> (dBA) |
|----------------------|---|--------------------|--|-----------------------|------------------------|------------------------|
| NM1                  | Central Eastern Property Boundary, adjacent to Redlands Boulevard | 10:00 – 10:15 a.m. | Approximately 100 feet to centerline of Redlands Boulevard | 61                    | 52                     | 72                     |
| NM2                  | Central Southern Property Boundary                                | 9:31 – 9:46 a.m.   | Approximately 240 feet from Spruce Avenue                  | 54                    | 49                     | 60                     |

Detailed sound level measurement data are included in Appendix A.

**Table 3 Sound Level Monitoring Traffic Counts**

| Measurement    | Roadway            | Traffic             | Autos      | Medium Trucks | Heavy Trucks |
|----------------|--------------------|---------------------|------------|---------------|--------------|
| NM1            | Redlands Boulevard | 15-minute count     | 132        | 7             | 4            |
|                |                    | One-hour Equivalent | 528        | 28            | 16           |
| <b>Percent</b> |                    |                     | <b>92%</b> | <b>5%</b>     | <b>3%</b>    |
| NM2            | Spruce Avenue      | 15-minute count     | 6          | 3             | 1            |
|                |                    | One-hour Equivalent | 16         | 12            | 4            |
| <b>Percent</b> |                    |                     | <b>50%</b> | <b>38%</b>    | <b>12%</b>   |

Detailed sound level measurement data are included in Appendix A.

## 2.5 Applicable Regulatory Setting

### Federal

#### *FTA Transit and Noise Vibration Impact Assessment Manual*

The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction in their *Transit and Noise Vibration Impact Assessment Manual* (FTA 2018). For residential, commercial, and industrial uses, the daytime noise threshold is 80 dBA L<sub>eq</sub>, 85 dBA L<sub>eq</sub>, and 90 dBA L<sub>eq</sub> for an 8-hour period, respectively.

### State

California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires each county and city to adopt a General Plan that includes a Noise Element prepared per guidelines adopted by the Governor's Office of Planning and Research. The purpose of the Noise Element is to limit the exposure of the community to excessive noise levels. CEQA requires all known environmental effects of a project be analyzed, including environmental noise impacts.

#### *California Noise Control Act of 1973*

California Health and Safety Code Sections 46000 through 46080, known as the California Noise Control Act, find that excessive noise is a serious hazard to public health and welfare and that exposure to certain levels of noise can result in physiological, psychological, and economic damage.

The act also finds that there is a continuous and increasing bombardment of noise in urban, suburban, and rural areas. The California Noise Control Act declares that the State of California has a responsibility to protect the health and welfare of its citizens by the control, prevention, and abatement of noise. It is the policy of the State to provide an environment for all Californians that is free from noise that jeopardizes their health or welfare.

### **City of Moreno Valley Noise Standards**

The Noise Element of the City of Moreno Valley General Plan provides a description of existing noise levels and sources and incorporates comprehensive goals and policies. The General Plan includes the Community Noise Compatibility Matrix, which establishes acceptable noise, conditionally acceptable, normally unacceptable, and clearly unacceptable noise levels for various land uses. Ambient noise levels up to 70 dBA CNEL are normally acceptable and ambient noise levels up to 77.5 dBA CNEL are conditionally acceptable for commercial development (City of Moreno Valley 2021). The following goals and policies from the Noise Element applicable to the project:

**Goal N-1:** Design for a pleasant, healthy sound environment conducive to living and working.

Policies:

N.1-2: Guide the location and design of transportation facilities, industrial uses, and other potential noise generators to minimize the effects of noise on adjacent land uses.

N.1-3: Apply the community noise compatibility standards (Table N-1) to all new development and major redevelopment projects outside the noise and safety compatibility zones established in the March Air Reserve Base/ Inland Port Airport Land Use Compatibility (ALUC) Plan in order to protect against the adverse effects of noise exposure. Projects within the noise and safety compatibility zones are subject to the standards contained in the ALUC Plan.

N.1-4: Require a noise study and/or mitigation measures if applicable for all projects that would expose people to noise levels greater than the “normally acceptable” standard and for any other projects that are likely to generate noise in excess of these standards.

N.1-5: Noise impacts should be controlled at the noise source where feasible, as opposed to at receptor end with measures to buffer, dampen, or actively cancel noise sources. Site design, building orientation, building design, hours of operation, and other techniques, for new developments deemed to be noise generators shall be used to control noise sources.

N.1-6: Require noise buffering, dampening, or active cancellation, on rooftop or other outdoor mechanical equipment located near residences, parks, and other noise sensitive land uses.

**Goal N-2:** Ensure that noise does not have a substantial, adverse effect on the quality of life in the community.

Policies:

N.2-1: Use the development review process to proactively identify and address potential noise compatibility issues.

N.2-2: Continue to work with community members and business owners to address noise complaints and ensure voluntary resolution of issues through the enforcement of Municipal Code provisions.

N.2-3: Limit the potential noise impacts of construction activities on surrounding land uses through noise regulations in the Municipal Code that address allowed days and hours of construction, types of work, construction equipment, and sound attenuation devices.

The Noise Ordinance included in Chapter 11.80 of the Moreno Valley Municipal Code provides performance standards and noise control guidelines for operational activities and for construction activities, as described below.

### *Operational Noise Standards*

Moreno Valley Municipal Code Section 11.80.030.C, Nonimpulsive Sound Decibel Limits, provides the following restriction:

No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any nonimpulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 (Table 5 of this report) when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance. (Moreno Valley n.d. Section 11.80.030.C)

For industrial and commercial land uses, based on the commercial land use standard of Moreno Valley Municipal Code Table 11.80.030-2 (Table 5 of this report), the operational noise level limits are 65 dBA  $L_{eq}$  during the daytime hours (8:00 a.m. to 10:00 p.m.) and 60 dBA  $L_{eq}$  during the nighttime hours (10:00 p.m. to 8:00 a.m.). Therefore, at a distance of 200 feet from the property line, operational noise from commercial and industrial buildings is not permitted to exceed 65 dBA  $L_{eq}$  during the day and 60 dBA  $L_{eq}$  during the night.

- A. **General Prohibition.** It is unlawful and a violation of this chapter to maintain, make, cause, or allow the making of any sound that causes a noise disturbance, as defined in Section 11.80.020.
- B. **Sound Causing Permanent Hearing Loss**
  - 1. **Sound level limits.** Based on statistics from the Center for Disease Control and Prevention and the National Institute for Occupational Safety and Health, Table 1 (Table 4 of this report) specifies sound level limits which, if exceeded, will have a high probability of producing permanent hearing loss in anyone in the area where the sound levels are being exceeded. No sound shall be permitted within the city which exceeds the parameters set forth in Table 11.80.030-1 (Table 4 of this report), of this chapter:

**Table 4 City of Moreno Valley Maximum Continuous Sound Levels<sup>1</sup>**

| Duration per Day Continuous Hours | Sound level [dbA] |
|-----------------------------------|-------------------|
| 8                                 | 90                |
| 6                                 | 92                |

<sup>1</sup>When the daily sound exposure is composed of two or more periods of sound exposure at different levels, the combined effect of all such periods shall constitute a violation of this section if the sum of the percent of allowed period of sound exposure at each level exceeds 100 percent.

Source: Moreno Valley Municipal Code, Title 11 Peace, Morals and Safety, Table 11.80.030-1.

- C. **Non-impulsive Sound Decibel Limits.** No person shall maintain, create, operate or cause to be operated on private property any source of sound in such a manner as to create any non-impulsive sound which exceeds the limits set forth for the source land use category (as defined in Section 11.80.020) in Table 11.80.030-2 (Table 5 of this report), when measured at a distance of two hundred (200) feet or more from the real property line of the source of the sound, if the sound occurs on privately owned property, or from the source of the sound, if the sound occurs on public right-of-way, public space or other publicly owned property. Any source of sound in violation of this subsection shall be deemed prima facie to be a noise disturbance.

**Table 5 City of Moreno Valley Maximum Sound Levels (in dBA) for Source Land Uses**

| Residential |           | Commercial |           |
|-------------|-----------|------------|-----------|
| Daytime     | Nighttime | Daytime    | Nighttime |
| 60          | 55        | 65         | 60        |

Source: Moreno Valley Municipal Code, Title 11 Peace, Morals and Safety, Table 11.80.030-2.

- D. **Specific Prohibitions.** In addition to the general prohibitions set out in subsection A of this section, and unless otherwise exempted by this chapter, the following specific acts, or the causing or permitting thereof, are regulated as follows:
- 7 **Construction and Demolition.** No person shall operate or cause the operation of any tools or equipment used in construction, drilling, repair, alteration or demolition work between the hours of 8:00 p.m. and 7:00 a.m. the following day such that the sound there from creates a noise disturbance, except for emergency work by public service utilities or for other work approved by the city manager or designee. This section shall not apply to the use of power tools as provided in subsection (D)(9) of this section.
  - 9 **Power Tools.** No person shall operate or permit the operation of any mechanically, electrically or gasoline motor driven tool during nighttime hours so as to cause a noise disturbance across a residential real property boundary.

## 3 Methodology

---

### 3.1 Construction Noise

Construction noise was estimated using the FHWA Roadway Construction Noise Model (RCNM) (FHWA 2006). RCNM predicts construction noise levels for a variety of construction operations based on empirical data and the application of acoustical propagation formulas. Using RCNM, construction noise levels were estimated at noise sensitive receivers near the project site. RCNM provides reference noise levels for standard construction equipment, with an attenuation rate of 6 dBA per doubling of distance for stationary equipment.

Variation in power imposes additional complexity in characterizing the noise source level from construction equipment. Power variation is accounted for by describing the noise at a reference distance from the equipment operating at full power and adjusting it based on the duty cycle of the activity to determine the  $L_{eq}$  of the operation (FHWA 2006). Each phase of construction has a specific equipment mix, depending on the work to be accomplished during that phase. Each phase also has its own noise characteristics; some will have higher continuous noise levels than others, and some have high-impact noise levels.

Construction activity would result in temporary noise in the project site vicinity, exposing surrounding nearby receivers to increased noise levels. Construction noise would typically be higher during the heavier periods of initial construction (i.e., site preparation and grading) and would be lower during the later construction phases (i.e., building construction and paving). Typical heavy construction equipment during project grading could include dozers, loaders, graders, and dump trucks. It is assumed that diesel engines would power all construction equipment. Construction equipment would not all operate at the same time or location. In addition, construction equipment would not be in constant use during the 8-hour operating day.

Project construction would occur nearest to the office-zoned single-family residences to the south of the project site. Over the course of a typical construction day, construction equipment would be located as close as 50 feet to the properties but would typically be located at an average distance farther away due to the nature of construction and the lot size of the project. For example, during a typical construction day, the equipment may operate across the horizontal distance of the site (150 to 350 feet) from a nearby noise receiver to the south of the project site. Single family residential uses are located across Redlands Boulevard to the east of the project site. Construction equipment would be located as close as 100 feet to these properties but would typically operate at an average distance of 200 feet. Therefore, it is assumed that over the course of a typical construction day the construction equipment would operate at an average distance of 150 feet from the office-zoned single-family residences to the south and 200 feet from single family residences to the east of the project site.

Construction noise is typically loudest during activities that involve excavation and move soil, such as site preparation and grading. A potential high-intensity construction scenario includes a grader, loader, dozer, and dump truck working during grading to excavate and move soil. At a distance of 100 feet, a grader, a front-end loader, a dozer, and a dump truck would generate a noise level of 78 dBA  $L_{eq}$  (RCNM calculations are included in Appendix B).

## 3.2 Groundborne Vibration

The project does not include any substantial vibration sources associated with operation. Thus, construction activities have the greatest potential to generate groundborne vibration affecting nearby receivers, especially during grading and excavation of the project site. The greatest vibratory source during construction within the project vicinity would be a large bulldozer. Neither blasting nor pile driving would be required for construction of the project. Construction vibration estimates are based on vibration levels reported by Caltrans and the FTA (Caltrans 2020, FTA 2018). Table 6 shows typical vibration levels for various pieces of construction equipment used in the assessment of construction vibration (FTA 2018).

**Table 6 Vibration Levels Measured during Construction Activities**

| Equipment       | PPV at 25 ft. (in/sec) |
|-----------------|------------------------|
| Large Bulldozer | 0.089                  |
| Loaded Trucks   | 0.076                  |
| Small Bulldozer | 0.003                  |

Source: FTA 2018

Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors; therefore, the vibration level threshold is assessed at occupied structures (FTA 2018). Therefore, all vibration impacts are assessed at the structure of an affected property.

## 3.3 Operational Noise Sources

On-site noise source would include general conversations, landscape maintenance, waste hauling, and the heating, ventilation, and air conditioning (HVAC) equipment. There are no large gathering areas on the project site and these sources would be transient in nature as people transit from vehicles to the store or fuel pumps. Therefore, general conversations would not represent a substantial noise source. Landscape maintenance and waste hauling typically occur during the less noise sensitive daytime hours and would be active for short periods of time. Thus, the primary noise source of concern would be associated with mechanical equipment.

### **Retail Store and Food Mart Mechanical Equipment**

Noise-generating mechanical equipment on the retail store and food mart rooftops include HVAC units and an exhaust fan (food mart only). The equipment was assumed to be placed on the approximate center of the rooftop; noise levels for the equipment are described below. This analysis conservatively assumes the equipment would operate continuously for a full hour (100 percent for 60 minutes) during the daytime and nighttime. For a conservative assessment, it has been assumed that the equipment would not include any type of screening.

#### *Heating, Ventilation, and Air Conditioning Units*

Based upon one ton of HVAC per 600 sf of building space and the square footage of each proposed building shown on the site plan, one 3-ton Carrier 38HDR036 Performance Series Air Conditioner unit is estimated to be required for the retail store and one 10-ton Carrier 38AUD14 HVAC unit is

estimated to be required for the food mart (see Appendix C for manufacturer’s specifications). The units for the retail store and food mart would generate an approximate sound power level of 72 dBA and 79 dBA; respectively, see Table 7 for noise spectrum data.

**Table 7 HVAC Noise Levels**

| HVAC Unit | Noise Levels in dB <sup>1</sup> Measured at Octave Frequencies |        |        |       |       |       |       | Overall Noise Level in A-weighted Scale (dBA) <sup>1</sup> |
|-----------|--|--------|--------|-------|-------|-------|-------|--|
|           | 125 Hz   | 250 Hz | 500 Hz | 1 KHz | 2 KHz | 4 KHz | 8 KHz |  |
| 3-ton     | 56.5   | 63.0   | 65.0   | 66.0  | 64.0  | 62.5  | 57.0  | 72   |
| 10-ton    | 78.6   | 78.1   | 75.1   | 75.2  | 71.4  | 67.9  | 65.1  | 79   |

<sup>1</sup> Noise Levels for 3-ton Carrier HDR38 Performance Series and 10-ton Carrier 38AUD14 rooftop HVAC units (see Appendix C for specification sheets).

Hz = Hertz; KHz = kilohertz

### *Roof Exhaust Fan*

The food mart would also potentially include a roof exhaust fan on the rooftop of the building. It has been assumed that a Greencheck G-090-VG Direct Drive Centrifugal Roof Exhaust Fan would be used for the project (see Appendix D for manufacturer’s specifications). This unit would generate an approximate sound power level of 66 dBA; see Table 8 for noise spectrum data.

**Table 8 Roof Exhaust Fan Noise Levels**

| 63 Hz | Noise Levels in dB <sup>1</sup> Measured at Octave Frequencies |        |        |       |       |       |       | Overall Noise Level in A-weighted Scale (dBA) <sup>1</sup> |
|-------|--|--------|--------|-------|-------|-------|-------|--|
|       | 125 Hz   | 250 Hz | 500 Hz | 1 KHz | 2 KHz | 4 KHz | 8 KHz |  |
| 77    | 74   | 69     | 63     | 58    | 55    | 51    | 44    | 55   |

<sup>1</sup> Noise Levels for a Greencheck G-090-VG Direct Drive Centrifugal Roof Exhaust Fan (see Appendix D for specification sheets).

Hz = Hertz; KHz = kilohertz

## 3.4 Traffic Noise

Noise affecting the project site is primarily from traffic on Redlands Boulevard. Traffic noise was modeled with the FHWA RD-77-108 Traffic Noise Prediction Model. The Traffic Impact Analysis (Gandini 2019) traffic volumes were input into the model as shown in Table 9.

**Table 9 Traffic Volumes**

| Roadway            | Segment  | Existing ADT | Existing with Project ADT | Opening Year 2024 ADT | Opening Year 2024 with Project ADT | General Plan Buildout Year 2040 ADT | General Plan Buildout Year 2040 with Project ADT |
|--------------------|--|--------------|---------------------------|-----------------------|------------------------------------|-------------------------------------|--|
| Redlands Boulevard | Ironwood Ave to Hemlock Avenue                   | 15,070       | 15,680                    | 19,300                | 19,900                             | 23,500                              | 24,100   |
|                    | Hemlock Ave to SR 60 WB Ramps                    | 14,470       | 15,010                    | 18,600                | 19,100                             | 23,600                              | 22,400   |
|                    | SR 60 WB Ramps to Eucalyptus Avenue              | 11,760       | 12,520                    | 19,400                | 20,200                             | 27,200                              | 28,100   |
| Ironwood Avenue    | West of Redlands Boulevard to Redlands Boulevard | 4,420        | 4,570                     | 5,100                 | 5,200                              | 9,000                               | 9,200  |
|                    | Redlands Boulevard to east of Redlands Boulevard | 730          | 880                       | 2,600                 | 2,700                              | 6,200                               | 6,400  |
| Hemlock Avenue     | West of Redlands Boulevard to Redlands Boulevard | –            | 530                       | –                     | 500                                | 4,100                               | 5,900  |
| Eucalyptus Avenue  | West of Redlands Boulevard to Redlands Boulevard | 670          | 970                       | 9,200                 | 9,500                              | 11,200                              | 11,500   |
|                    | Redlands Boulevard to east of Redlands Boulevard | 330          | 630                       | 2,200                 | 2,500                              | 9,200                               | 9,500  |

See Appendix E for traffic volumes.  
 Source: Ganddini 2019

The posted speed limits on Redlands Boulevard, Ironwood Avenue, Hemlock Avenue, and Eucalyptus Avenue are 50 miles per hour (mph), 55 mph, 25 mph, and 35 mph, respectively. To determine the vehicle classification mix for modeling, the observed mix from the site measurement was used, which observed 92 percent automobiles, 5 percent medium trucks, and 3 percent heavy trucks.

### 3.5 Significance Thresholds

The following thresholds are based on City of Moreno Valley noise standards and Appendix G of the CEQA Guidelines. Noise impacts would be considered significant if:

- **Item 1.** The project would result in the generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
  - Based on the Moreno Valley Municipal Code Chapters 11.80, construction noise would be significant if:
    - Noise levels exceed the FTA daytime criteria of 80 dBA  $L_{eq}$ , 85 dBA  $L_{eq}$ , and 90 dBA  $L_{eq}$  for an 8-hour period for residential, commercial, and industrial land uses, respectively.
    - Construction and demolition work are conducted between the hours of 8:00 p.m. and 7:00 a.m.

- Based on Moreno Valley Municipal Code Table 11.80.030-2, operational noise would be significant if:
  - Noise levels exceed 60 dBA from 8:00 a.m. to 10:00 p.m. or 55 dBA from 10:00 p.m. to 8:00 a.m.
- Traffic-related noise impacts would be considered significant if project-generated traffic would result in exposure of sensitive receivers to an unacceptable increase in noise levels.
  - For purposes of this analysis, a significant impact would occur if project-related traffic increases the ambient noise environment of noise-sensitive land uses by 3 dBA or more if the locations are subject to noise levels in excess of conditionally compatible levels, or by 5 dBA or more if the locations are not subject to noise levels in excess of the conditionally compatible levels identified in the City of Moreno Valley General Plan.
- **Item 2.** The project would result in the generation of excessive groundborne vibration or groundborne noise levels.
  - Vibration levels equal to or below 0.4 in./sec. PPV at residential structures would prevent structural damage for most residential building and vibration levels equal to or less than 1.0 in./sec. PPV would prevent damage to more substantial construction, such as high-rise, commercial, and industrial buildings. For human annoyance, the vibration level threshold at which transient, or temporary, vibration sources are considered to be distinctly perceptible is 0.24 in./sec. PPV.
- **Item 3.** For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, if the project exposes people residing or working in the project area to excessive noise levels.

## 4 Impact Analysis

### 4.1 Item 1 – Temporary and Permanent Noise Increase

**Item:** Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies? (*Less Than Significant Impact*)

#### Construction

As described in Section 3.1, at a distance of 100 feet, a grader, front-end loader, a dozer, and a dump truck would generate a noise level of 78 dBA  $L_{eq}$ . For the Highway Office/Commercial (H-OC) District designated parcels developed with single-family and commercial uses to the south, project construction noise levels would be 74 dBA  $L_{eq}$  and 72 dBA  $L_{eq}$ , respectively (see Appendix B for construction noise modeling results). The FTA’s daytime construction noise limit is 80 dBA for residential uses; therefore, project construction noise levels would not exceed construction noise thresholds. In addition, construction activities would be restricted to daytime hours per the Moreno Valley Municipal Code Chapters 11.80 allowed hours of 7:00 a.m. and 7:00 p.m. Therefore, impacts from construction noise would be less than significant.

#### Operation

The project would introduce sources of operational noise to the site, including mechanical equipment (HVAC units and exhaust fan). Assumptions for these sources are discussed in Section 3.3. Noise levels at the nearest properties from each noise source and their combined noise levels are shown in Table 10.

**Table 10 Operational Noise Levels at Off-site Land Uses**

| Receiver    | Description                  | Noise Level (dBA $L_{eq}$ ) |             |             |          | Exceed Thresholds? <sup>4</sup> |
|-------------|------------------------------|-----------------------------|-------------|-------------|----------|---------------------------------|
|             |                              | 3-ton HVAC                  | 10-ton HVAC | Exhaust Fan | Combined |                                 |
| Residential | South of site <sup>1,2</sup> | 37                          | 44          | 20          | 45       | No                              |
| Residential | East of site <sup>3</sup>    | 36                          | 44          | 20          | 45       | No                              |

<sup>1</sup> South of site residential receivers are located on properties that are zoned office use.

<sup>2</sup> Assumes 280 feet to residence south of the site

<sup>3</sup> Assumes 285 feet to residence east of the site

<sup>4</sup> Thresholds would be exceeded if exterior noise levels exceed 60 dBA from 7:00 a.m. to 10:00 p.m. or 55 dBA from 10:00 p.m. to 7:00 a.m.

See Figure 4 for receiver locations.

As shown in Table 10, combined operational activities on the project site would generate noise levels up to 45 dBA  $L_{eq}$  at nearby Highway Office/Commercial (H-OC) District and Residential 1 (R1) District properties. The combined operational noise from the retail store and food mart mechanical equipment would not exceed Moreno Valley’s daytime and nighttime noise standards of 60 dBA and 55 dBA  $L_{eq}$ , respectively.

### Off-site Traffic Noise

The project would generate new vehicle trips that would increase noise levels on nearby roadways, which would occur primarily on Redlands Boulevard. The increase in roadway noise with the addition of project traffic is shown in Table 11. Traffic data was obtained from the project's Traffic Impact Analysis (Ganddini 2019). Due to the relatively small increase in overall ADT volumes from project-generated traffic, the noise level increases would range between 0.1 dBA  $L_{dn}$  to be 2.8 dBA  $L_{dn}$ . One project area roadway segment, Eucalyptus Avenue from Redlands Boulevard to east of Redlands Boulevard would experience the largest traffic noise level increase, 2.8 dBA  $L_{dn}$ , when comparing existing to existing plus project traffic scenario. It should be noted that there are no noise sensitive receivers along this roadway segment. Furthermore, the project's traffic noise increase would not exceed 3 dBA or more, and impacts would be less than significant.

## 4.2 Item 2 – Vibration

**Item:** Would the project result in generation of excessive groundborne vibration or groundborne noise levels? (*Less Than Significant Impact*)

Construction activities known to generate excessive groundborne vibration, such as pile driving, would not be conducted by the project. The greatest anticipated source of vibration during general project construction activities would be from a large bulldozer, which may be used within 50 feet of the nearest off-site structure. A large bulldozer creates approximately 0.089 in./sec. PPV at a distance of 25 feet (Caltrans 2020). This would equal a vibration level of 0.0315 in./sec. PPV at 50 feet. This vibration level is lower than the threshold of 0.24 in./sec. PPV. Therefore, temporary impacts associated with construction would be less than significant.

The project does not include any substantial vibration sources associated with operation. Therefore, operational vibration impacts would be less than significant.

## 4.3 Item 3 – Airport Noise

**Item:** For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels? (*No Impact*)

The March Air Reserve Base/Inland Port Airport is the nearest airport, located approximately 6.7 miles to the southwest of the project site. According to the noise compatibility contours figure for the March Air Reserve Base/Inland Port Airport Land Use Compatibility Plan (Riverside County Airport Land Use Commission 2014), the project site is located outside the airport's 60 dBA CNEL noise contour. Therefore, no substantial noise exposure from airport noise would occur to construction workers, users, or employees of the project, and no impacts would occur.

**Table 11 Traffic Noise Levels (dBA L<sub>dn</sub> at 50 Feet)**

| Roadway            | Segment  | Existing | Existing with Project Traffic | Increase with Project Traffic | Opening Year 2024 | Opening Year 2024 with Project Traffic | Increase with Project Traffic | General Plan Buildout Year 2040 | General Plan Buildout Year 2040 with Project Traffic | Increase with Project Traffic |
|--------------------|--|----------|-------------------------------|-------------------------------|-------------------|--|-------------------------------|---------------------------------|--|-------------------------------|
| Redlands Boulevard | Ironwood Ave to Hemlock Avenue                   | 68.4     | 68.6                          | 0.2                           | 69.5              | 69.6                                   | 0.1                           | 70.3                            | 70.4   | 0.1                           |
|                    | Hemlock Ave to SR 60 WB Ramps                    | 68.2     | 68.4                          | 0.2                           | 69.3              | 69.4                                   | 0.1                           | 70.3                            | 70.1   | -0.2                          |

## 5 Conclusions

---

The project would generate both temporary construction-related noise and long-term noise associated with operation of the project. Construction noise would not exceed Moreno Valley Municipal Code noise standards at the nearby land uses and impacts from construction noise would be less than significant.

Combined operational activities on the project site would generate noise levels up to 45 dBA  $L_{eq}$  at nearby residential office-zoned and residential-zoned properties, to the south and east of the site, respectively. The combined operational noise from the mechanical equipment would comply with Moreno Valley's daytime and nighttime noise standards, and the project would be consistent with the Moreno Valley noise standards.

Project-generated traffic would generate an increase of up to 2.8 dBA on analyzed roadways. The roadway segment of Eucalyptus Avenue from Redlands Boulevard to east of Redlands Boulevard would experience the largest traffic noise level increase, 2.8 dBA  $L_{dn}$ , when comparing existing to existing plus project traffic scenario only, however, there are no noise sensitive receivers along this roadway segment to be impacted. Traffic noise increases due to the project is below the threshold of 3 dBA; therefore, the off-site traffic noise increase would be less than significant.

The project would generate groundborne vibration during construction. Groundborne vibration would not exceed the applicable vibration threshold at the nearest structures, and construction-related vibration impacts would be less than significant.

The project site is outside the noise contours for the March Air Reserve Base/Inland Port Airport. Therefore, no substantial noise exposure would occur to construction workers, employees, or users of the project from aircraft noise.

Given the aforementioned, the project as designed would result in less than significant impacts and no mitigation is necessary.

Noise Measurement Data

# Ambient Noise Survey Data Sheet

Instructions: Document noise measurement locations with a photo of the site, including the noise meter. Additionally, take notes on general and secondary noise sources, including the instantaneous noise level if possible. As a reminder, A/C weighting should be set to "A", and response time should typically be set to "slow." For additional information, please review the Noise Measurement Protocols in the case or on file.

Project Name: Redlands & Hemlock Ave Gas Job Number: 21-10878  
 Date: 3/16/2021 Operator Name: Destiny Timms

## Measurement #1

Location: NM 1 Begin time: 10:00 Finish time: 10:15  
 Measurement No.: 002 Wind (mph): 5 Direction: SSE

Cloud Cover Class: Overcast (>80%) Light (20-80%) Sunny (<20%)

Calibration (dB): Start: 94.6 End: 94.9

Primary Noise Sources: Redlands Blvd Distance: 100 Ft from centerline

Secondary Noise Sources: 60 Freeway

Notes: Dogs barking from adj residential from east  
Stopped @ 7 MINS

Traffic Count: Passenger Cars: (132)

Redlands Blvd Medium Trucks (2 axles, 6 tires): ||||| (7) Heavy Trucks (3+ axles): ||| (4)

Instantaneous Noise Sources/Levels (e.g., airplane, bus airbrake, etc.):

L<sub>eq</sub>: 61.2 SEL: 90.7 L<sub>max</sub>: 72.3 L<sub>min</sub>: 51.7 PK: 86.1  
 L(05): 64.6 L(10): 63.6 L(50): 60.3 L(90): 55.7 L(95): 54.7

Response: Slow Fast Peak Impulse

## Measurement #2

Location: NM 2 Begin time: 9:31 Finish time: 9:46  
 Measurement No.: 001 Wind (mph): 5 Direction: SE

Cloud Cover Class: Overcast (>80%) Light (20-80%) Sunny (<20%)

Calibration (dB): Start: 95.5 End: 94.7

Primary Noise Sources: Spruce Distance: 238 ft from centerline

Secondary Noise Sources: 60 Freeway

Notes: Rooster crowing from adj land use,  
BRDS in trees from Moreno Ranch Supply

Traffic Count: Passenger Cars: ||||| (6)

ON SPRUCE Medium Trucks (2 axles, 6 tires): ||| (3) Heavy Trucks (3+ axles): 1 (1)

Instantaneous Noise Sources/Levels (e.g., airplane, bus airbrake, etc.):

L<sub>eq</sub>: 53.8 SEL: 83.3 L<sub>max</sub>: 59.7 L<sub>min</sub>: 49.4 PK: 78.3  
 L(05): 56.4 L(10): 55.6 L(50): 53.1 L(90): 51.3 L(95): 50.7

Response: Slow Fast Peak Impulse

HVAC Unit Specifications

**38HDR  
Performance™ Series Air Conditioner  
with Puron® Refrigerant  
1 – 1/2 to 5 Nominal Tons**

Turn to the Experts.™

## Product Data

### INDUSTRY LEADING FEATURES / BENEFITS

Performance  
SERIES

Carrier's Air Conditioners with Puron® refrigerant provide a collection of features unmatched by any other family of equipment. The 38HDR has been designed utilizing Carrier's Puron refrigerant. The environmentally sound refrigerant allows you to make a responsible decision in the protection of the earth's ozone layer.

As an Energy Star® Partner, Carrier Corporation has determined that this product meets the Energy Star® guidelines for energy efficiency. Refer to the combination ratings in the Product Data for system combinations that meet Energy Star® guidelines.

**NOTE: Ratings contained in this document are subject to change at any time. Always refer to the AHRI directory ([www.ahridirectory.org](http://www.ahridirectory.org)) for the most up-to-date ratings information.**

#### Energy Efficiency

- 13 - 15 SEER/10.9 - 12.5 EER

#### Sound

- Levels as low as 68 dBA

#### Design Features

- New aesthetics
- Small footprint, same as old model and "stackable"
- WeatherArmor™ cabinet
  - All steel cabinet construction
  - Baked on powder paint
  - Mesh coil guard

#### Reliability, Quality and Toughness

- Scroll compressor
- Crankcase Heater standard on sizes 030-060
- Factory-supplied filter drier
- High pressure switch
- Low pressure switch
- Line lengths up to 250' (76.2 m)
- Low ambient operation (down to -20°F/-28.9°C) with low ambient accessories.

This product has been designed and manufactured to meet Energy Star® criteria for energy efficiency when matched with appropriate coil components. However, proper refrigerant charge and proper air flow are critical to achieve rated capacity and efficiency. Installation of this product should follow all manufacturing refrigerant charging and air flow instructions. **Failure to confirm proper charge and air flow may reduce energy efficiency and shorten equipment life.**

\* See *Liquid Line Sizing For Cooling Only Systems with Puron Refrigerant* tables.

† Units are rated with 25 ft (7.6 m) of lineset length. See *Vapor Line Sizing and Cooling Capacity Loss* table when using other sizes and lengths of lineset.

‡ 24 v and a minimum of 40 va is provided in the fan coil unit.

\*\* Vapor connection size is 7/8 inch.

FPI – Fins Per Inch

POE – Polyol Ester

# REFRIGERANT PIPING LENGTH LIMITATIONS

## Liquid Line Sizing and Maximum Total Equivalent Lengths† for Cooling Only Systems with Puron® Refrigerant:

The maximum allowable length of a residential split system depends on the liquid line diameter and vertical separation between indoor and outdoor units.

See Table below for liquid line sizing and maximum lengths :

### Maximum Total Equivalent Length Outdoor Unit BELOW Indoor Unit

| Size                 | Liquid Line Connection | Liquid Line Diam. w/ TXV | AC with Puron Refrigerant Maximum Total Equivalent Length†: Outdoor unit BELOW Indoor Vertical Separation ft (m) |                |                 |                 |                  |                   |                   |                   |                   |

\* Maximum actual length not to exceed 200 ft (61 m)

† Total equivalent length accounts for losses due to elbows or fitting. See the Long Line Guideline for details.

-- = outside acceptable range

## REFRIGERANT CHARGE ADJUSTMENTS

| Liquid Line Size | Puron Charge oz/ft (g/m)                                       |
|------------------|--|
| 3/8              | 0.60 (17.74)<br>(Factory charge for lineset = 9 oz / 266.16 g) |
| 5/16             | 0.40 (11.83)   |
| 1/4              | 0.27 (7.98)  |

Units are factory charged for 15 ft (4.6 m) of 3/8" liquid line. The factory charge for 3/8" lineset 9 oz (266.16 g). When using other length or diameter liquid lines, charge adjustments are required per the chart above.

### Charging Formula:

$[(\text{Lineset oz/ft} \times \text{total length}) - (\text{factory charge for lineset})] = \text{charge adjustment}$

**Example 1:** System has 15 ft of line set using existing 1/4" liquid line. What charge adjustment is required?

Formula:  $(.27 \text{ oz/ft} \times 15\text{ft}) - (9 \text{ oz}) = (-4.95) \text{ oz.}$

Net result is to remove 4.95 oz of refrigerant from the system

**Example 2:** System has 45 ft of existing 5/16" liquid line. What is the charge adjustment?

Formula:  $(.40 \text{ oz/ft.} \times 45\text{ft}) - (9 \text{ oz.}) = 9 \text{ oz.}$

Net result is to add 9 oz of refrigerant to the system

## LONG LINE APPLICATIONS

An application is considered Long Line, when the refrigerant level in the system requires the use of accessories to maintain acceptable refrigerant management for systems reliability. See Accessory Usage Guideline table for required accessories. Defining a system as long line depends on the liquid line diameter, actual length of the tubing, and vertical separation between the indoor and outdoor units.

For Air Conditioner systems, the chart below shows when an application is considered Long Line.

### AC WITH PURON® REFRIGERANT LONG LINE DESCRIPTION ft (m) Beyond these lengths, long line accessories are required

| Liquid Line Size | Units On Same Level                          | Outdoor Below Indoor                         | Outdoor Above Indoor |
|------------------|--|--|----------------------|
| 1/4              | No accessories needed within allowed lengths | No accessories needed within allowed lengths | 175 (53.3)           |
| 5/16             | 120 (36.6)                                   | 50 (15.2) vertical or 120 (36.6) total       | 120 (36.6)           |
| 3/8              | 80 (24.4)                                    | 35 (10.7) vertical or 80 (24.4) total        | 80 (24.4)            |

**Note:** See Long Line Guideline for details

## VAPOR LINE SIZING AND COOLING CAPACITY LOSS

Acceptable vapor line diameters provide adequate oil return to the compressor while avoiding excessive capacity loss. The suction line diameters shown in the chart below are acceptable for AC systems with Puron refrigerant:

### Vapor Line Sizing and Cooling Capacity Losses — Puron® Refrigerant 1-Stage Air Conditioner Applications

| Unit Nominal Size (Btuh)           | Maximum Liquid Line Diameters (In. OD) | Vapor Line Diameters (In. OD) | Cooling Capacity Loss (%)            |                      |                       |                        |                        |                        |                        |                        |                        |

# ACCESSORY USAGE GUIDELINE

| ACCESSORY                                   | REQUIRED FOR LOW-AMBIENT COOLING APPLICATIONS (Below 55°F/12.8°C) | REQUIRED FOR LONG LINE APPLICATIONS* (Over 80 ft. / 24.4 m) | REQUIRED FOR SEA COAST APPLICATIONS (Within 2 miles / 3.2 km) |
|---|---|---|---|
| Compressor Start Assist Capacitor and Relay | Yes   | Yes   | No  |
| Crankcase Heater                            | Yes   | Yes   | No  |
| Evaporator Freeze Thermostat                | Yes   | No  | No  |
| Hard Shutoff TXV                            | Yes   | Yes   | Yes   |
| Liquid Line Solenoid Valve                  | No  | See Longline Application Guideline                          | No  |
| Low-ambient Control                         | Yes   | No  | No  |
| Winter Start Control                        | Yes   | No  | No  |

\* For tubing line sets between 80 and 200 ft. (24.38 and 60.96 m) and/or 35 ft. (10.7 m) vertical differential, refer to Residential Piping and Longline Guideline.

## Accessory Description and Usage (Listed Alphabetically)

### 1. Crankcase Heater

An electric resistance heater which mounts to the base of the compressor to keep the lubricant warm during off cycles. Improves compressor lubrication on restart and minimizes the chance of liquid slugging.

Usage Guideline:

- Required in low ambient cooling applications.
- Required in long line applications.
- Suggested in all commercial applications.

### 2. Evaporator Freeze Thermostat

An SPST temperature-actuated switch that stops unit operation when evaporator reaches freeze-up conditions.

Usage Guideline:

- Required when low ambient kit has been added.

### 3. Low-Ambient Control

A fan-speed control device activated by a temperature sensor, designed to control condenser fan motor speed in response to the saturated, condensing temperature during operation in cooling mode only. For outdoor temperatures down to -20°F (-28.9°C), it maintains condensing temperature at 100°F ±10°F (37.8°C ± 5.5°C).

Usage Guideline:

- A Low Ambient Controller must be used when cooling operation is used at outdoor temperatures below 55°F (12.8°C).

Suggested for all commercial applications.

### 4. Outdoor Air Temperature Sensor

Designed for use with Carrier Thermostats listed in this publication. This device enables the thermostat to display the outdoor temperature. This device also

is required to enable special thermostat features such as auxiliary heat lock out.

Usage Guideline:

- Suggested for all Carrier thermostats listed in this publication.

### 5. Thermostatic Expansion Valve (TXV)

A modulating flow-control valve which meters refrigerant liquid flow rate into the evaporator in response to the superheat of the refrigerant gas leaving the evaporator.

Kit includes valve, adapter tubes, and external equalizer tube. Hard shut off types are available.

**NOTE:** When using a hard shut off TXV with single phase reciprocating compressors, a Compressor Start Assist Capacitor and Relay is required.

Usage Guideline:

- Accessory required to meet ARI rating and system reliability, where indoor not equipped.
- Hard shut off TXV or LLS required in air conditioner long line applications.
- Required for use on all zoning systems.

### 6. Time-Delay Relay

An SPST delay relay which briefly continues operation of indoor blower motor to provide additional cooling after the compressor cycles off.

**NOTE:** Most indoor unit controls include this feature. For those that do not, use the guideline below.

Usage Guideline:

- Accessory required to meet ARI rating, where indoor not equipped.

### 7. Winter Start Control

This control is designed to alleviate nuisance opening of the low-pressure switch by bypassing it for the first 3 minutes of operation.

\* Permissible limits of the voltage range at which the unit will operate satisfactorily

**FLA** – Full Load Amps

**HACR** – Heating, Air Conditioning, Refrigeration

**LRA** – Locked Rotor Amps

**NEC** – National Electrical Code

**RLA** – Rated Load Amps (compressor)

**NOTE:** Control circuit is 24-V on all units and requires external power source. Copper wire must be used from service disconnect to unit. All motors/compressors contain internal overload protection.

Complies with 2007 requirements of ASHRAE Standards 90.1

† Tested combination

**EER** — Energy Efficiency Ratio

**SEER** — Seasonal Energy Efficiency Ratio

**TDR** — Time-Delay Relay. In most cases, only 1 method should be used to achieve TDR function. Using more than 1 method in a system may cause degradation in performance. Use either the accessory Time-Delay Relay KAATD0101TDR or a furnace equipped with TDR. Most Carrier furnaces are equipped with TDR.

**TXV** — Thermostatic Expansion Valve

**NOTES:**

1. Ratings are net values reflecting the effects of circulating fan motor heat. Supplemental electric heat is not included.
2. Tested outdoor/indoor combinations have been tested in accordance with DOE test procedures for central air conditioners. Ratings for other combinations are determined under DOE computer simulation procedures.
3. Determine actual CFM values obtainable for your system by referring to fan performance data in fan coil or furnace coil literature.
4. Do not apply with capillary tube coils as performance and reliability are significantly affected.

**NOTE:** When the required data fall between the published data, interpolation may be performed. Extrapolation is not an acceptable practice.

\* Detailed cooling capacities are based on indoor and outdoor unit at the same elevation per the latest edition of AHRI standard 210/240. If additional tubing length and/or indoor unit is located above outdoor unit, a slight variation in capacity may occur.

† Total and sensible capacities are net capacities. Blower motor heat has been subtracted.

‡ Sensible capacities shown are based on 80° F (27° C) entering air at the indoor coil. For sensible capacities at other than 80° F (27° C), deduct 835 Btu/h (245 kW) per 1000 CFM (480 L/S) of indoor coil air for each degree below 80° F (27° C), or add 835 Btu/h (245 kW) per 1000 CFM (480 L/S) of indoor coil air per degree above 80° F (27° C).

When the required data fall between the published data, interpolation may be performed.

\*\* Total system kW is total of indoor and outdoor unit kilowatts.

# GUIDE SPECIFICATIONS

## GENERAL

### System Description

Outdoor-mounted, air-cooled, split-system air conditioner unit suitable for ground or rooftop installation. Unit consists of a hermetic compressor, an air-cooled coil, propeller-type condenser fan, and a control box. Unit will discharge supply air horizontally as shown on contract drawings. Unit will be used in a refrigeration circuit to match up to a packaged fan coil or coil unit.

### Quality Assurance

- Unit will be rated in accordance with the latest edition of ARI Standard 210.
- Unit will be certified for capacity and efficiency, and listed in the latest ARI directory.
- Unit construction will comply with latest edition of ANSI/ASHRAE and with NEC.
- Unit will be constructed in accordance with UL standards and will carry the UL label of approval. Unit will have c-UL approval.
- Unit cabinet will be capable of withstanding Federal Test Method Standard No. 141 (Method 6061) 500-hr salt spray test.
- Air-cooled condenser coils will be leak tested and pressure tested
- Unit constructed in ISO9001 approved facility.

### Delivery, Storage, and Handling

- Unit will be shipped as single package only and is stored and handled per unit manufacturer's recommendations.

### Warranty (for inclusion by specifying engineer)

- U.S. and Canada only.

## PRODUCTS

### Equipment

- Factory assembled, single piece, air-cooled air conditioner unit. Contained within the unit enclosure is all factory wiring, piping, controls, compressor, refrigerant charge Puron® (R-410A), and special features required prior to field start-up.

### Unit Cabinet

- Unit cabinet will be constructed of galvanized steel, bonderized, and coated with a powder coat paint.

### Fans

- Condenser fan will be direct-drive propeller type, discharging air horizontally.

## AIR-COOLED, SPLIT-SYSTEM AIR CONDITIONER

38HDR

1-1/2 TO 5 NOMINAL TONS

- Condenser fan motors will be totally enclosed, 1-phase type with class B insulation and permanently lubricated bearings. Shafts will be corrosion resistant.
- Fan blades will be statically and dynamically balanced.
- Condenser fan openings will be equipped with coated steel wire safety guards.

### Compressor

- Compressor will be hermetically sealed.
- Compressor will be mounted on rubber vibration isolators.

### Condenser Coil

- Condenser coil will be air cooled.
- Coil will be constructed of aluminum fins mechanically bonded to copper tubes which are then cleaned, dehydrated, and sealed.

### Refrigeration Components

- Refrigeration circuit components will include liquid-line front-seating shutoff valve with sweat connections, vapor-line front-seating shutoff valve with sweat connections, system charge of Puron® (R-410A) refrigerant, and compressor oil.
- Unit will be equipped with high-pressure switch, low pressure switch and filter drier for Puron refrigerant.

### Operating Characteristics

- The capacity of the unit will meet or exceed \_\_\_\_\_ Btuh at a suction temperature of \_\_\_\_\_ °F/°C. The power consumption at full load will not exceed \_\_\_\_\_ kW.
- Combination of the unit and the evaporator or fan coil unit will have a total net cooling capacity of \_\_\_\_\_ Btuh or greater at conditions of \_\_\_\_\_ CFM entering air temperature at the evaporator at \_\_\_\_\_ °F/°C wet bulb and \_\_\_\_\_ °F/°C dry bulb, and air entering the unit at \_\_\_\_\_ °F/°C.
- The system will have a SEER of \_\_\_\_\_ Btuh/watt or greater at DOE conditions.

### Electrical Requirements

- Nominal unit electrical characteristics will be \_\_\_\_\_ v, single phase, 60 hz. The unit will be capable of satisfactory operation within voltage limits of \_\_\_\_\_ v to \_\_\_\_\_ v.
- Nominal unit electrical characteristics will be \_\_\_\_\_ v, three phase, 60 hz. The unit will be capable of satisfactory operation within voltage limits of \_\_\_\_\_ v to \_\_\_\_\_ v.
- Unit electrical power will be single point connection.
- Control circuit will be 24v.

### Special Features

- Refer to section of this literature identifying accessories and descriptions for specific features and available enhancements.

38HDR

## SYSTEM DESIGN SUMMARY

1. Intended for outdoor installation with free air inlet and outlet. Outdoor fan external static pressure available is less than 0.01-in. wc.
2. Minimum outdoor operating air temperature without low-ambient operation accessory is 55°F (12.8°C).
3. Maximum outdoor operating air temperature is 125°F (51.7°C).
4. For reliable operation, unit should be level in all horizontal planes.
5. For interconnecting refrigerant tube lengths greater than 80 ft (23.4 m) and/or 35 ft (10.7 m) vertical differential, consult Residential Piping and Longline Guideline and Service Manual available from equipment distributor.
6. If any refrigerant tubing is buried, provide a 6 in. (152.4 mm) vertical rise to the valve connections at the unit. Refrigerant tubing lengths up to 36 in. (914.4 mm) may be buried without further consideration. Do not bury refrigerant lines longer than 36 in. (914.4 mm).
7. Use only copper wire for electric connection at unit. Aluminum and clad aluminum are not acceptable for the type of connector provided.
8. Do not apply capillary tube indoor coils to these units.
9. Factory-supplied filter drier must be installed.

Greenheck Fan Corporation certifies that the model shown herein is licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and AMCA Publication 311 and comply with the requirements of the AMCA Certified Ratings Program. Performance certified is for installation type A: Free inlet, Free outlet. Power rating (BHP/kW) does not include transmission losses. Performance ratings include the effects of birdscreen. The sound ratings shown are loudness values in fan sones at 5 ft. (1.5 m) in a hemispherical free field calculated per AMCA Standard 301. Values shown are for installation type A: free inlet hemispherical sone levels. dBA levels are not licensed by AMCA International. The AMCA Certified Ratings Seal for Sound applies to inlet sone ratings only.

FLA - based on tables 150 or 148 of National Electric Code 2002. Actual motor FLA may vary, for sizing thermal overload, consult factory.

Greenheck Fan Corporation certifies that the model shown herein is licensed to bear the AMCA Seal. The ratings shown are based on tests and procedures performed in accordance with AMCA Publication 211 and comply with the requirements of the AMCA Certified Ratings Program. The AMCA Certified Ratings Seal applies to air performance ratings only. Performance certified is for installation type D: Ducted inlet, Ducted outlet. Power rating (BHP/kW) does not include transmission losses. Performance ratings include the effects of a backdraft damper. Speed (RPM) shown is nominal. Performance is based on actual speed of test. The sound ratings shown are for loudness values in spherical sones at 5 ft. (1.5m) in a spherical free field calculated per Annex B of AMCA 311. Values shown are for installation type D: ducted inlet spherical sone levels. Ratings do not include the effects of duct end correction. Ratings are based on 10 ft. of insulated duct. The AMCA Certified Ratings Seal applies to air performance only.

Wattage is shown at free air. Wattage is approximate and may vary between motors. Fan shaft input power (bhp) is not certified. FLA - based on tables 150 or 148 of National Electric Code 2002. Actual motor FLA may vary, for sizing thermal overload, consult factory.
